# Package 'eeptools’ 

May 3, 2020
Type Package
Title Convenience Functions for Education Data
Version 1.2.4
Description Collection of convenience functions to make working with administrative records easier and more consistent. Includes functions to clean strings, and identify cut points. Also includes three example data sets of administrative education records for learning how to process records with errors.

License GPL-3
Depends R (>= 2.15.1), ggplot2
Imports arm, data.table, vcd, maptools
Suggests testthat, stringr, knitr, rmarkdown, MASS
LazyData true
Encoding UTF-8
VignetteBuilder knitr
RoxygenNote 7.0.2

age_calc Function to calculate age from date of birth.

## Description

his function calculates age in days, months, or years from a date of birth to another arbitrary date. This returns a numeric vector in the specified units.

## Usage

```
age_calc(dob, enddate = Sys.Date(), units = "months", precise = TRUE)
```

## Arguments

dob
enddate a vector of class Date representing the when the observation's age is of interest, defaults to current date.
units character, which units of age should be calculated? allowed values are days, months, and years
precise logical indicating whether or not to calculate with leap year and leap second precision

## Value

A numeric vector of ages the same length as the dob vector

## Author(s)

Jason P. Becker

## Source

This function was developed in part from this response on the R-Help mailing list.

## See Also

See also difftime which this function uses and mimics some functionality but at higher unit levels.

## Examples

```
a <- as.Date(seq(as.POSIXct('1987-05-29 018:07:00'), len=26, by="21 day"))
b <- as.Date(seq(as.POSIXct('2002-05-29 018:07:00'), len=26, by="21 day"))
age <- age_calc(a, units='years')
age
age <- age_calc(a, units='months')
age
age <- age_calc(a, as.Date('2005-09-01'))
age
```

autoplot.lm

A function to replicate the basic plot function for linear models in ggplot2

## Description

This uses ggplot2 to replicate the plot functionality for 1 lm in ggplot2 and allow themes.

## Usage

```
## S3 method for class 'lm'
autoplot(object, which = c(1:6), mfrow = c(3, 2), ...)
```

## Arguments

| object | a linear model object from lm |
| :--- | :--- |
| which | which of the tests do we want to display output from |
| mfrow | Describes the layout of the resulting function in the plot frames |
| $\ldots$ | additional parameters to pass through |

## Value

A ggplot2 object that mimics the functionality of a plot of linear model.

## References

Modified from: http://librestats.com/2012/06/11/autoplot-graphical-methods-with-ggplot2/

## See Also

plot. lm which this function mimics

## Examples

```
# Univariate
a <- runif(1000)
b <- 7 * a + rnorm(1)
mymod <- lm(b~a)
autoplot(mymod)
# Multivariate
data(mpg)
mymod <- lm(cty~displ + cyl + drv, data=mpg)
autoplot(mymod)
```

cleanTex

Remove Unwanted LaTeX files after building document

## Description

Convenience function for cleaning up your directory after running pdflatex

## Usage

cleanTex(fn, keepPDF = TRUE, keepRnw = TRUE, keepRproj = TRUE)

## Arguments

| fn | a filename for your .Rnw file |
| :--- | :--- |
| keepPDF | Logical. Should function save PDF files with filename fn. Default is TRUE. |
| keepRnw | Logical. Should function save Rnw files with filename fn. Default is TRUE. |
| keepRproj | Logical. Should function save .Rproj files with filename fn. Default is TRUE. |

## Value

Nothing. All files except the .tex, .pdf and .Rnw are removed from your directory.

```
crosstabplot
Draw a visual crosstab (mosaic plot) with shading for correlations and labels in each cell.
```

## Description

Improves labeling of mosaic plots over mosaic from the vcd package

## Usage

crosstabplot(
data,
rowvar,
colvar,
varnames,
title = NULL,
subtitle = NULL,
label = FALSE,
shade = TRUE,
)

## Arguments

| data | a data object, matrix or dataframe, that contains the categorical variables to com- <br> pose the crosstab <br> a character value for the column in data that will be displayed on the rows of the <br> crosstab |
| :--- | :--- |
| rowvar | a character value for the column in data that will be displayed in columns of the <br> crosstab |
| colvar | a character vector of length two with the labels for rowvar and colvar respec- <br> tively |
| title | a character vector of length one that contains the main title for the plot <br> a character vector of length one that contains the subtitle displayed beneath the |
| subtitle | plot |

| label | logical, if TRUE cells will be labeled, else they will not |
| :--- | :--- |
| shade | logical, if TRUE cells will be shaded with Pearson residuals |
| $\ldots$ | additional arguments to crosstabs e.g. digits |

## Value

A mosaic plot

## Source

http://www.rexdouglass.com/blog:3

## See Also

mosaic which this function wraps crosstabs which does the data manipulation for the crosstab

## Examples

```
df <- data.frame(cbind(x=seq(1,3,by=1), y=sample(LETTERS[6:8],60,replace=TRUE)),
fac=sample(LETTERS[1:4], 60, replace=TRUE))
varnames<-c('Quality','Grade')
myCT <- crosstabs(df, rowvar = "x",colvar = "fac", varnames = varnames, digits =2)
crosstabplot(df, rowvar = "x",colvar = "fac", varnames = varnames,
title = 'My Plot', subtitle = 'Foo', label = FALSE, shade = TRUE, digits = 3)
```

```
crosstabs Build a list of crosstabulations from a dataset
```

## Description

Build a list of crosstabulations from a dataset

## Usage

crosstabs(data, rowvar, colvar, varnames, digits = 2)

## Arguments

| data | a data object, matrix or dataframe, that contains the categorical variables to com- <br> pose the crosstab <br> a character value for the column in data that will be displayed on the rows of the <br> crosstab |
| :--- | :--- |
| rowvar | a character value for the column in data that will be displayed in columns of the <br> crosstab |
| colvar | a character vector of length two with the labels for rowvar and colvar respec- <br> tively <br> an integer for how much to round the proportion calculations by, default is 2 |
| digits | an |

## Value

a list with crosstab calculations

## Examples

```
df<-data.frame(cbind(x=seq(1,3,by=1), y=sample(LETTERS[6:8],60,replace=TRUE)),
fac=sample(LETTERS[1:4], 60, replace=TRUE))
varnames<-c('Quality','Grade')
myCT <- crosstabs(df, rowvar = "x",colvar = "fac", varnames = varnames, digits =2)
```

```
cutoff
```

A function to calculate thresholds of cumulative sums in a vector.

## Description

This function tells us how far we have to go before reaching a cutoff in a variable by sorting the vector, then finding how far to go. Note that the cutoff is expressed in percentage terms (fixed cumulative sum)

## Usage

cutoff(x, cutoff, na.rm = TRUE)

## Arguments

x a numeric vector, missing values are allowed
cutoff a user defined numeric value to stop the cutoff specified as a proportion 0 to 1
na.rm
logical, should missing values be excluded?

## Details

Calculates the distance through a numeric vector before a certain proportion of the sum is reached by sorting the vector and calculating the cumulative proportion of each element

## Value

An integer for the minimum number of elements necessary to reach cutoff

## Author(s)

Jared E. Knowles

## Examples

```
# for vector
a <- rnorm(100, mean=6, sd=1)
cutoff(a, .7) #return minimum number of elements to account 70 percent of total
```

## Description

A shortcut function to strip commas out of numeric fields imported from other software and convert them into numeric vectors that can be operated on. This assumes decimal point as opposed to decimal comma notation.

## Usage

decomma( x )

## Arguments

 being numeric.

## Details

This function assumes decimal point notation for numbers. For more information, see http://en. wikipedia.org/wiki/Decimal_mark\#Countries_using_Arabic_numerals_with_decimal_point.

## Value

A numeric

## Author(s)

Jared E. Knowles

## Examples

```
input <- c("10,243", "11,212", "7,011", "5443", "500")
output <- decomma(input)
is.numeric(output)
```

```
defac Convert a factor to a character string safely
```

## Description

This is a shortcut function to convert a factor to a character variable without having to type as.character()

## Usage

defac (x)

## Arguments

x
a factor to be turned into a character

## Value

A character

## Author(s)

Jared E. Knowles

## See Also

factor, levels to understand the R implementation of factors.

## Examples

```
a <- as.factor(LETTERS)
summary(a)
b <- defac(a)
class(b)
```

eeptools Evaluation of educational policy tools

## Description

Make common tasks for educational evaluation easier to do!

## Details

| Package: | eeptools |
| :--- | :--- |
| Type: | Package |
| Version: | 1.2 .0 |
| Date: | $2018-06-01$ |
| License: | GPL-3 |

his package has a number of useful shortcuts for common tasks. It includes some themes for ggplot2 plots, processing arbitrary text files of data, calculating student characteristics, and finding thresholds within vectors. Future development work will include methods for tuning and evaluating early warning system models.

## Note

This package is still in beta and function names may change in the next release.

## Author(s)

Jared E. Knowles

## Examples

```
gender<-c("M", "M", "M", "F", "F", "F")
statamode(gender)
statamode(gender[1:5])
missing_data<-c(NA,NA,NA)
max_mis(missing_data)
makenum(gender)
gender <- factor(gender)
defac(gender)
```

    gelmansim Generate prediction intervals for model functions
    
## Description

Generate prediction intervals from R models following Gelman and Hill

## Usage

gelmansim(mod, newdata, n.sims, na.omit = TRUE)

## Arguments

mod $\quad$ Name of a model object such as lm, glm, or merMod
newdata Sets of new data to generate predictions for
n.sims Number of simulations per case
na.omit Logical indicating whether to remove NAs from newdata

## Details

Currently gelmansim does not work for $1 m$ objects because of the way sim in the arm package handles variable names for these objects. It is recommended users use glm in these cases.

## Value

A dataframe with newdata and prediction intervals

## References

Modified from Gelman and Hill 2006. Data Analysis Using Regression and Multilevel/Hierarchical Models. Cambridge University Press.

## Examples

```
#Examples of "sim"
set.seed (1)
J <- 15
n <- J*(J+1)/2
group <- rep (1:J, 1:J)
mu.a <- 5
sigma.a <- 2
a <- rnorm (J, mu.a, sigma.a)
b <- -3
x <- rnorm (n, 2, 1)
sigma.y <- 6
y <- rnorm (n, a[group] + b*x, sigma.y)
u <- runif (J, 0, 3)
y123.dat <- cbind (y, x, group)
# Linear regression
x1 <- y123.dat[,2]
y1 <- y123.dat[,1]
M1 <- glm (y1 ~ x1)
cases <- data.frame(x1 = seq(-2, 2, by=0.1))
sim.results <- gelmansim(M1, newdata=cases, n.sims=200, na.omit=TRUE)
## Not run:
dat <- as.data.frame(y123.dat)
M2 <- glm (y1 ~ x1 + group, data=dat)
cases <- expand.grid(x1 = seq(-2, 2, by=0.1),
    group=seq(1, 14, by=2))
```

    sim.results <- gelmansim(M2, newdata=cases, n.sims=200, na.omit=TRUE)
    \#\# End(Not run)

| ggmapmergeA depcrecated method for fortifying SpatialPolygonsDataFrames for <br> plotting |
| :--- |

## Description

Convenience function for fortifying SpatialPolygonsDataFrames for ggplot2 plotting.

## Usage

ggmapmerge(mapobj, xid)

## Arguments

| mapobj | Name of an S4 SpatialPolygonsDataFrame |
| :--- | :--- |
| xid | Name of ID variable in the SpatialPolygonsDataFrame |

## Details

This function requires maptools to be loaded and gpclibPermit to be TRUE. This is because it depends on the fortify method in ggplot2.

## Value

An S3 dataframe suitable for using in a gggplot2 map

## Examples

```
## Not run:
xx <- maptools::readShapePoly(system.file("shapes/sids.shp", package="maptools")[1], IDvar="FIPSNO")
plotobj <- ggmapmerge(xx,"FIPS")
## End(Not run)
```

A function to check if a set of variables form a unique ID in a dataframe.

## Description

When passed a set of variable names and a dataframe, this function returns a check TRUE/FALSE whether or not the variables together uniquely identify a row in the dataframe.

## Usage

isid(data, vars, verbose = FALSE)

## Arguments

data A dataframe.
vars A character vector specifying the column names in the dataframe to check as unique.
verbose A logical, default FALSE. If TRUE, isid will tell you how many rows you need and how many your variables uniquely identify

## Value

TRUE or FALSE. TRUE indicates the variables uniquely identify the rows. FALSE indicates they do not.

## Author(s)

Jared E. Knowles

## Examples

```
data(stuatt)
isid(stuatt, vars = c("sid"))
isid(stuatt, vars = c("sid", "school_year"))
isid(stuatt, vars = c("sid", "school_year"), verbose = TRUE)
```

lag_data Create a lag

## Description

Lag variables by an arbitrary number of periods even if the data is grouped

## Usage

lag_data(df, group, time, periods, values)

## Arguments

df
A dataframe with groups, time periods, and a variable to be lagged
group The grouping factor in the dataframe
time The variable representing time periods
periods A scalar for the number of periods to be lagged in the data. Can be negative to indicate leading variable.
values $\quad$ The names of the variables to be lagged

## Value

A dataframe with a newly created variable lagged

## Examples

```
test_data <- expand.grid(id = sample(letters, 10),
            time = 1:10)
test_data$value1 <- rnorm(100)
test_data$value2 <- runif(100)
test_data$value3 <- rpois(100, 4)
group <- "id"
time <- "time"
values <- c("value1", "value2")
vars <- c(group, time, values)
periods <- 2
newdat <- lag_data(test_data, group="id", time="time",
    values=c("value1", "value2"), periods=3)
```

## Description

This function ensures that fixed width data is the right length by padding zeroes to the front of values. This is a common problem with fixed width data after importing into R as non-character type.

## Usage

leading_zero(x, digits = 2)

## Arguments

$x \quad a \quad v e c t o r ~ o f ~ n u m e r i c ~ d a t a ~ t h a t ~ s h o u l d ~ b e ~ f i x e d ~ w i d t h ~ b u t ~ i s ~ m i s s i n g ~ l e a d i n g ~ z e r o e s . ~$
digits an integer representing the desired width of $x$

## Details

If $x$ contains negative values then the width specified by digits will include one space taken up for the negative sign. The function does not trim values that are longer than digits, so the vector produced will not have a uniform width if nchar $(x)>d$

## Value

A character vector of length digits

## Author(s)

Jason P. Becker
Jared E. Knowles

## Examples

```
a <- seq(1,10)
a <- leading_zero(a, digits = 3)
a
```

## Description

This function allows you to convert directly from a numeric factor to the numeric class in R and strip away the underlying level index of a factor. This makes it safer to convert from factors to numeric characters directly without accidentally misassigning numbers.

## Usage

makenum( $x$ )

## Arguments

$x \quad a$ factor with numeric levels

## Details

This function should only be used on factors where all levels are valid numbers that can be coerced into a numeric class.

## Value

A numeric

## Note

This will force all levels to be converted to characters and then to numeric objects. Leading zeroes will be stripped off and commas will cause errors.

## Author(s)

Jared E. Knowles

## See Also

```
character
```

## Examples

```
a <- ordered(c(1, 3, '09', 7, 5))
b <- makenum(a)
class(b)
b
a
```

mapmerge | A depcrecated method for converting polygons to dataframes Combine |
| :--- |
| an S4 polygon object with a dataframe |

## Description

Convenience function for merging dataframes and S4 spatial polygon objects.

## Usage

mapmerge(mapobj, data, xid, yid)

## Arguments

| mapobj | Name of an S4 SpatialPolygonsDataFrame |
| :--- | :--- |
| data | Name of a dataframe |
| xid | Name of ID variable in the SpatialPolygonsDataFrame |
| yid | Name of ID variable in the dataframe |

## Value

A SpatialPolygonsDataFrame with new variables attached from supplied dataframe

## Examples

```
## Not run:
xx <- maptools::readShapePoly(system.file("shapes/sids.shp", package="maptools")[1], IDvar="FIPSNO")
yy <- as(xx,"data.frame")
yy$newvar <- sample(letters, nrow(yy), replace=TRUE)
yy <- subset(yy, select=c("FIPS", "newvar"))
newpoly <- mapmerge(xx, yy, xid="FIPS", yid="FIPS")
## End(Not run)
```

max_mis $\quad$| A function to safely take the maximum of a vector that could include |
| :--- |
| only NAs. | only NAs.

## Description

When computing the maximum on arbitrary subsets of data, some of which may only have missing values, it may be necessary to take the maximum of a vector of NAs. This replaces the behavior that returns Inf or-Inf and replaces it with simply returning an NA.

## Usage

max_mis(x)

## Arguments

$x \quad$ A vector of data that a maximum can be taken of.

## Details

This function only returns valid results for vectors with a mix of NA and numeric values.

## Value

A vector with the maximum value or with an NA of the proper type

## Author(s)

Jared E. Knowles

## See Also

See also max which this function wraps.

## Examples

```
max(c(7,NA, 3, 2,0), na.rm=TRUE)
max_mis(c(7,NA, 3, 2,0))
max(c(NA,NA,NA,NA), na.rm=TRUE)
max_mis(c(NA,NA,NA,NA))
```

    midsch A dataframe of aggregate test scores for schools in a Midwest state.
    
## Description

This data comes from publicly available aggregated test scores of a large midwestern state. Each row represents scores for school A in grade X and then scores in school A and grade $\mathrm{X}+1$. Additionally, some regression diagnostics and results from a predictive model of test scores in grade $\mathrm{X}+1$ are included.

## Usage

midsch
moves_calc

## Format

A data frame with 19985 observations on the following 16 variables.
district_id a numeric vector
school_id a numeric vector
subject a factor with levels math read representing the subject of the test scores in the row
grade a numeric vector
n 1 a numeric vector for the count of students in the school and grade in t
ss1 a numeric vector for the scale score in $t$
n 2 a numeric vector for the count of students in the school and grade in $\mathrm{t}+1$
ss2 a numeric vector for the mean scale score in $t+1$
predicted a numeric vector of the predicted ss2 for this observation
residuals a numeric vector of residuals from the predicted ss2
resid_z a numeric vector of standardized residuals
resid_t a numeric vector of studentized residuals
cooks a numeric vector of cooks $D$ for the residuals
test_year a numeric vector representing the year the test was taken
tprob a numeric vector representing the probability of a residual appearing
flagged_t95 a numeric vector

## Details

These data were fit with a statistical model by a large newspaper to investigate unusual gains in test scores. Fifty separate models were fit representing all unique combinations of grade,year, and subject

## Examples

```
data(midsch)
head(midsch)
```

```
moves_calc
```

Function to calculate the number of times a student has changed schools.

## Description

This function calculates the number of times a student has changed schools, including accounting for gaps in enrollment data. It returns a data. table with the student ID and the number of student moves.

## Usage

```
    moves_calc(
        df,
        enrollby,
        exitby,
        gap = 14,
        sid = "sid",
        schid = "schid",
        enroll_date = "enroll_date",
        exit_date = "exit_date"
    )
```

## Arguments

df a data.frame containing minimally a student identifier, school identifier, enrollment date, and exit date.
enrollby a date that determines the earliest a student can enroll for the first time without being credited with having moved at least once.
exitby a date that determines the latest a student can exit for the final time without being credited with having moved at least once.
gap a number, of days, that represents the largest gap between an exit date and the next enrollment date that can occur without indicating the student moved to a third school not contained within the data set. The default value is 14 .
sid a character that indicates the name of the student id attribute in df. The default value is sid.
schid a character that indicates the name of the school id attribute in df . The default value is schid.
enroll_date a character that indicates the name of the enrollment date attribute in df . The default value is enroll_date.
exit_date a character that indicates the name of the student id attribute in df. The default value is exit_date.

## Details

enrollby and exitby are specified automatically if not defined. They are assigned to the default dates of -09-15 and -06-01 of the min and max year respectively.

## Value

a data.frame

## Author(s)

Jason P. Becker

## Examples

```
    ## Not run:
    df <- data.frame(sid = c(rep(1,3), rep(2,4), 3, rep(4,2)),
        schid = c(1, 2, 2, 2, 3, 1, 1, 1, 3, 1),
        enroll_date = as.Date(c('2004-08-26',
            '2004-10-01',
                '2005-05-01',
                '2004-09-01',
                '2004-11-03',
                '2005-01-11',
                '2005-04-02',
                '2004-09-26',
                '2004-09-01',
                '2005-02-02'),
                format='%Y-%m-%d'),
    exit_date = as.Date(c('2004-08-26',
                '2005-04-10',
                    '2005-06-15',
                    '2004-11-02',
                    '2005-01-10',
                        '2005-03-01',
                        '2005-06-15',
                    '2005-05-30',
                    NA,
                        '2005-06-15'),
                            format='%Y-%m-%d' ))
moves <- moves_calc(df)
    moves
    moves <- moves_calc(df, enrollby='2004-10-15', gap=22)
    moves
    moves <- moves_calc(df, enrollby='2004-10-15', exitby='2005-05-29')
    moves
    ## End(Not run)
```

    nth_max Find the nth maximum value
    
## Description

Find the nth maximum value

## Usage

$$
n t h \_\max (x, n=1)
$$

## Arguments

$x \quad a \quad$ vector of numeric values
n which max to return

## Value

the value of the nth most maximum value in a vector

Note
If n is smaller/larger than $0 /$ length(unique $(x)$ ) the error 'index outside bounds' is thrown.

## Examples

```
    x <- c(1:20, 20:1)
    nth_max(x, n = 1) #20
    nth_max(x, n = 2) #19
```

profpoly Creates a proficiency polygon in ggplot2 for showing assessment cat- egories

## Description

Creates a proficiency polygon in ggplot2 for showing assessment categories

## Usage

profpoly(data)

## Arguments

data a data.frame produced by profpoly.data

## Value

a ggplot 2 object that can be printed or saved

## See Also

geom_polygon which this function wraps

## Examples

```
grades<-c(3,4,5,6,7,8)
g <- length(grades)
LOSS <- rep(200, g)
HOSS <- rep(650, g)
basic <- c(320, 350,370, 390,420,440)
minimal <- basic-30
prof <- c(380,410,430,450,480,500)
adv <- c(480,510,530,550,580,600)
z <- profpoly.data(grades, LOSS, minimal, basic, proficient = prof,
advanced = adv, HOSS)
    profpoly(z)
```

profpoly.data Creates a data frame suitable for building custom polygon layers in ggplot 2 objects

## Description

Creates a data frame suitable for building custom polygon layers in ggplot2 objects

## Usage

profpoly.data(grades, LOSS, minimal, basic, proficient, advanced, HOSS)

## Arguments

grades a vector of tested grades in sequential order
LOSS is a vector of the lowest obtainable scale score on an assessment by grade
minimal is a vector of the floor of the minimal assessment category by grade
basic is a vector of the floor of the basic assessment category by grade
proficient is a vector of the floor of the proficient assessment category by grade
advanced is a vector of the floor of the advanced assessment category by grade
HOSS is a vector of the highest obtainable scale score by grade

## Value

a dataframe for adding a polygon to layers in other ggplot2 plots

## See Also

geom_polygon which this function assists

## Examples

```
grades<-c(3, 4, 5, 6, 7, 8)
g<-length(grades)
LOSS<-rep(200,6)
HOSS<-rep(650,6)
basic<-c(320, 350, 370, 390,420, 440)
minimal<-basic-30
prof<-c(380,410,430,450,480,500)
adv<-c(480,510,530,550,580,600)
z<-profpoly.data(grades,LOSS,minimal,basic,
    proficient = prof,advanced = adv, HOSS)
z
```

| remove_char | A function to replace an arbitrary character like a $" * "$ in redacted data <br> with an NA in $R$ |
| :--- | :--- |

## Description

Redacted education data files often have a "*" character. When importing into R this is a problem, which this function solves in a simple step by replacing "*" with NA, and then converting the vector to numeric.

## Usage

remove_char (x, char)

## Arguments

$x \quad$ a vector of data that should be numeric but contains characters indicating redaction forcing R to read it as character
char the character string that should be removed from the vector.

## Value

Returns a vector of the same length as the input vector that is numeric with NAs in place of the character.

## Note

Future versions could be modified to accommodate other indicators of redacted data.

## Author(s)

Jared E. Knowles

## Examples

```
a <- c(1, 5, 3, 6, "*", 2, 5, "*", "*")
b <- remove_char(a, "*")
as.numeric(b)
```

## Description

This function calculates whether or not a student has repeated a grade. It returns a data.frame with the student ID and a character vector with $Y$ representing they repeated the grade and $N$ that they had not.

## Usage

```
retained_calc(df, sid = "sid", grade = "grade", grade_val = 9)
```

## Arguments

df a data.frame containing minimally a student identifier and their grade.
sid a character that indicates the name of the student id attribute in df. The default value is sid.
grade a character that indicates the name of the student grade attribute in df . The default value is grade.
grade_val a numeric vector that contains the value of the grade that is being checked for retention. The default value is 9 .

## Value

a data.frame

## Author(s)

Jason P. Becker

## Examples

```
x <- data.frame(sid = c(101, 101, 102, 103, 103, 103, 104),
    grade = c(9, 10, 9, 9, 9, 10, 10))
retained_calc(x)
```

## Description

This function mimics the functionality of the mode function in Stata. It does this by calculating the modal category of a vector and replacing tied categories with a "."to represent a single mode does not exist.

## Usage

statamode(x, method = c("last", "stata", "sample"))

## Arguments

x method
a vector, missing values are allowed
a character vector of length 1 specifying the way to break ties in cases where more than one mode exists; either "stata", "sample", or "last". "stata" provides a "." if more than one mode exists. "sample" randomly samples from among the tied values for a single mode. "last" takes the final modal category appearing in the data.

## Details

Specifying method="stata" will result in ties for the mode being replaced with a "." character. Specifying "sample" will result in the function randomly sampling among the tied values and picking a single value. Finally, specifying "last" will result in the function picking the value that appears last in the original x vector. The default behavior is stata.

## Value

The modal value of a vector if a unique mode exists, else output determined by method

## Author(s)

Jared E. Knowles

## See Also

table which this function uses

## Examples

```
a <- c(month.name, month.name)
statamode(a, method="stata") # returns "." to show no unique mode; useful for ddply
statamode(a ,method="sample") # randomly pick one
a <- c(LETTERS, "A" , "A")
statamode(a)
```

## Description

A synthetic dataset of student attributes from the Strategic Data Project which includes records with errors to practice data cleaning and implementing business rules for consistency in data.

## Usage

stuatt

## Format

A data frame with 87534 observations on the following 9 variables.
sid a numeric vector of the unique student ID
school_year a numeric vector of the school year
male a numeric vector indicating $1=$ male
race_ethnicity a factor with levels A B H M/O W
birth_date a numeric vector of the student birthdate
first_9th_school_year_reported a numeric vector of the first year a student is reported in 9th grade
hs_diploma a numeric vector
hs_diploma_type a factor with levels Alternative Diploma College Prep Diploma Standard Diploma
hs_diploma_date a factor with levels 12/2/2008 12/21/2008 4/14/2008 4/18/2008 ...

## Details

This is the non-clean version of the data to allow for implementing business rules to clean data.

## Examples

```
data(stuatt)
```

head(stuatt)
stulevel
A synthetic data set of $K-12$ student attributes.

## Description

A small dataset of synthetic data on K-12 students with 2700 observations. 1200 individual students are represented, nested within 4 districts and 2 schools.

## Usage

stulevel

## Format

A data frame with 2700 observations on the following 32 variables.
$X$ a numeric vector
school a numeric vector
stuid a numeric vector
grade a numeric vector
schid a numeric vector
dist a numeric vector
white a numeric vector
black a numeric vector
hisp a numeric vector
indian a numeric vector
asian a numeric vector
econ a numeric vector
female a numeric vector
ell a numeric vector
disab a numeric vector
sch_fay a numeric vector
dist_fay a numeric vector
luck a numeric vector
ability a numeric vector
measerr a numeric vector
teachq a numeric vector
year a numeric vector
attday a numeric vector
schoolscore a numeric vector
district a numeric vector
schoolhigh a numeric vector
schoolavg a numeric vector
schoollow a numeric vector
readSS a numeric vector
mathSS a numeric vector
proflvl a factor with levels advanced basic below basic proficient
race a factor with levels A B H I W

## Details

This data is synthetically generated to reflect student test scores and demographic attributes.

The script to generate this synthetic dataset can be found and modified at https://github.com/ jknowles/r_tutorial_ed

## Examples

```
data(stulevel)
head(stulevel)
```

```
theme_dpi
```

a deprecated ggplot2 theme developed for PDF and PNG for use at the Wisconsin Department of Public Instruction

## Description

This is a custom ggplot2 theme developed for the Wisconsin Department of Public Instruction. This function is now deprecated.

## Usage

theme_dpi(base_size = 16, base_family = "")

## Arguments

base_size numeric, specify the font size as a numeric value, default is 16
base_family character, specify the font family, this value is optional

## Details

All values are optional

## Value

A theme object which is a list of attributes applied to a ggplot2 object.

## Author(s)

Jared E. Knowles

## Source

For more information see https://github.com/hadley/ggplot2/wiki/Themes

## See Also

his uses unit from the grid package extensively. See also theme_bw from the ggplot2 package.
theme_dpi_map a deprecated ggplot2 theme developed for PDF or SVG maps

## Description

This is a deprecated ggplot2 theme developed for the Wisconsin Department of Public Instruction for making PDF maps

## Usage

theme_dpi_map(base_size = 14, base_family = "")

## Arguments

base_size numeric, specify the font size, default is 14
base_family character, specify the font family, this value is optional

## Details

All values are optional

## Value

A theme object which is a list of attributes applied to a ggplot2 object.

## Author(s)

Jared E. Knowles

## Source

For more information see https://github.com/hadley/ggplot2/wiki/Themes

## See Also

his uses unit from the grid package extensively. See also theme_bw from the ggplot2 package.

```
theme_dpi_map2 an alternate deprecated ggplot2 theme developed for PDF or SVG
                    maps
```

## Description

This is a deprecated ggplot2 theme developed for the Wisconsin Department of Public Instruction for making PDF maps

## Usage

theme_dpi_map2(base_size = 14, base_family = "")

## Arguments

base_size numeric, specify the font size, default is 14
base_family character, specify the font family, this value is optional

## Details

All values are optional

## Value

A theme object which is a list of attributes applied to a ggplot2 object.

## Author(s)

Jared E. Knowles

## Source

For more information see https://github.com/hadley/ggplot2/wiki/Themes

## See Also

his uses unit from the grid package extensively. See also theme_bw from the ggplot2 package.
theme_dpi_mapPNG an deprecated ggplot2 theme developed for PNG or JPG maps

## Description

This is a deprecated ggplot2 theme developed for the Wisconsin Department of Public Instruction for making PNG or JPG maps

## Usage

theme_dpi_mapPNG(base_size = 18, base_family = "")

## Arguments

base_size numeric, specify the font size, default is 18
base_family character, specify the font family, this value is optional

## Details

All values are optional

## Value

A theme object which is a list of attributes applied to a ggplot2 object.

## Author(s)

Jared E. Knowles

## Source

For more information see https://github.com/hadley/ggplot2/wiki/Themes

## See Also

his uses unit from the grid package extensively. See also theme_bw from the ggplot2 package.

## thresh

A function to return the maximum percentage of the cumulative sum represented by a subset of the vector

## Description

Returns the proportion of the cumulative sum represented by the number of elements in the vector a user specifies. This allows the user to identify the maximum proportion of the total that only X number of elements may represent in the vector.

## Usage

thresh(x, cutoff, na.rm = TRUE)

## Arguments

$x \quad$ a numeric vector, missing values are allowed
cutoff numeric, the number of elements to look at
na.rm logical, should missing values be excluded?

## Details

Calculates the proportion of a numeric vector reached after sorting the vector in ascending order and stopping at the specified count

## Value

A numeric proportion

## Author(s)

Jared E. Knowles

## See Also

cutoff which this function is related to

## Examples

```
# for vector
a <- rnorm(100, mean=6, sd=1)
thresh(a, 8) #return minimum number of elements to account 70 percent of total
```
