

Package ‘golem’

March 4, 2022

Title A Framework for Robust Shiny Applications

Version 0.3.2

Description An opinionated framework for building a production-ready 'Shiny' application. This package contains a series of tools for building a robust 'Shiny' application from start to finish.

License MIT + file LICENSE

activate_js*Interact with JavaScript built-in Functions*

Description

activate_js is used to insert directly some JavaScript functions in your golem. By default bundle_ressources() load these function automatically for you.

Usage

```
activate_js()  
  
invoke_js(fun, ..., session = shiny::getDefaultReactiveDomain())
```

Arguments

fun	JS function to be invoked.
...	JSON-like messages to be sent to the triggered JS function
session	The shiny session within which to call sendCustomMessage. show Show an element with the jQuery selector provided. Example: golem::invoke_js("show", "#id") hide Hide an element with the jQuery selector provided. Example: golem::invoke_js("hide", "#id") showid Show an element with the id provided. Example: golem::invoke_js("showid", "id"). hideid Hide an element with the id provided. Example: golem::invoke_js("hideid", "id"). showclass Same as showid, but with class. Example: golem::invoke_js("showclass", "someClass") hideclass Same as hideid, but with class. Example: golem::invoke_js("hideclass", "someClass"). showhref Same as showid, but with a[href*=]. Example: golem::invoke_js("showhref", "thinkr.fr") hidehref Same as hideid, but with a[href*=]. Example: golem::invoke_js("hidehref", "thinkr.fr") clickon Click on an element. The full jQuery selector has to be used. Example: golem::invoke_js("clickon", "#id"). disable Add "disabled" to an element. The full jQuery selector has to be used. Example: golem::invoke_js("disable", ".someClass"). reable Remove "disabled" from an element. The full jQuery selector has to be used. Example: golem::invoke_js("reable", ".someClass"). alert Open an alert box with the message(s) provided. Example: golem::invoke_js("alert", "WELCOME TO MY APP");. prompt Open a prompt box with the message(s) provided. This function takes a list with message and id list(message = "", id = ""). The output of the prompt will be sent to input\$id. Example: golem::invoke_js("prompt", list(message = "what's your name?", id = "name")). confirm Open a confirm box with the message provided. This function takes a list with message and id list(message = "", id = ""). The output of the prompt will be sent to input\$id. Example: golem::invoke_js("confirm", list(message = "Are you sure you want to do that?", id = "name")).

Details

These JavaScript functions can be called from the server with `invoke_js`. `invoke_js` can also be used to launch any JS function created inside a Shiny JavaScript handler.

Value

Used for side-effects.

Examples

```
if (interactive()) {
  library(shiny)
  ui <- fluidPage(
    golem::activate_js(), # already loaded in your golem by `bundle_resources()`
    fluidRow(
      actionButton(inputId = "hidebutton1", label = "hide button1"),
      actionButton(inputId = "showbutton1", label = "show button1"),
      actionButton(inputId = "button1", label = "button1")
    ),
    fluidRow(
      actionButton(inputId = "hideclassA", label = "hide class A"),
      actionButton(inputId = "showclassA", label = "show class A"),
      actionButton(inputId = "buttonA1", label = "button A1", class = "A"),
      actionButton(inputId = "buttonA2", label = "button A2", class = "A"),
      actionButton(inputId = "buttonA3", label = "button A3", class = "A")
    ),
    fluidRow(
      actionButton(inputId = "clickhide", label = "click on 'hide button1' and 'hide class A'"),
      actionButton(inputId = "clickshow", label = "click on 'show button1' and 'show class A'")
    ),
    fluidRow(
      actionButton(inputId = "disableA", label = "disable class A"),
      actionButton(inputId = "reableA", label = "reable class A")
    ),
    fluidRow(
      actionButton(inputId = "alertbutton", label = "alert button"),
      actionButton(inputId = "promptbutton", label = "prompt button"),
      actionButton(inputId = "confirmbutton", label = "confirm button")
    )
  )

  server <- function(input, output, session) {
    observeEvent(input$hidebutton1, {
      golem::invoke_js("hideid", "button1")
    })

    observeEvent(input$showbutton1, {
      golem::invoke_js("showid", "button1")
    })

    observeEvent(input$hideclassA, {
      golem::invoke_js("hideclass", "A")
    })
  }
}
```

```

  })
  observeEvent(input$showclassA, {
    golem::invoke_js("showclass", "A")
  })

  observeEvent(input$clickhide, {
    golem::invoke_js("clickon", "#hidebutton1")
    golem::invoke_js("clickon", "#hideclassA")
  })

  observeEvent(input$clickshow, {
    golem::invoke_js("clickon", "#showbutton1")
    golem::invoke_js("clickon", "#showclassA")
  })

  observeEvent(input$disableA, {
    golem::invoke_js("disable", ".A")
  })
  observeEvent(input$reableA, {
    golem::invoke_js("reable", ".A")
  })

  observeEvent(input$alertbutton, {
    golem::invoke_js("alert", "ALERT!!")
  })

  observeEvent(input$promptbutton, {
    golem::invoke_js("prompt", list(message = "what's your name?", id = "name"))
  })
  observeEvent(input$name, {
    message(paste("input$name", input$name))
  })

  observeEvent(input$confirmbutton, {
    golem::invoke_js("confirm", list(message = "Are you sure?", id = "sure"))
  })
  observeEvent(input$sure, {
    message(paste("input$sure", input$sure))
  })
}
shinyApp(ui, server)
}

```

addins

{golem} addins

Description

`insert_ns()` takes a selected character vector and wrap it in `ns()`. The series of `go_to_*`() addins help you go to common files used in developing a {golem} application.

Usage

```
insert_ns()
go_to_start()
go_to_dev()
go_to_deploy()
go_to_run_dev()
go_to_app_ui()
go_to_app_server()
go_to_run_app()
```

add_dockerfile *Create a Dockerfile for your App*

Description

Build a container containing your Shiny App. `add_dockerfile()` creates a generic Dockerfile, while `add_dockerfile_shinyproxy()` and `add_dockerfile_heroku()` creates platform specific Dockerfile.

Usage

```
add_dockerfile(
  path = "DESCRIPTION",
  output = "Dockerfile",
  pkg = get_golem_wd(),
  from = paste0("rocker/r-ver:", R.Version()$major, ".", R.Version()$minor),
  as = NULL,
  port = 80,
  host = "0.0.0.0",
  sysreqs = TRUE,
  repos = c(CRAN = "https://cran.rstudio.com/"),
  expand = FALSE,
  open = TRUE,
  update_tar_gz = TRUE,
  build_golem_from_source = TRUE,
  extra_sysreqs = NULL
)
add_dockerfile_shinyproxy()
```

```

path = "DESCRIPTION",
output = "Dockerfile",
pkg = get_golem_wd(),
from = paste0("rocker/r-ver:", R.Version()$major, ".", R.Version()$minor),
as = NULL,
sysreqs = TRUE,
repos = c(CRAN = "https://cran.rstudio.com/"),
expand = FALSE,
open = TRUE,
update_tar_gz = TRUE,
build_golem_from_source = TRUE,
extra_sysreqs = NULL
)

add_dockerfile_heroku(
  path = "DESCRIPTION",
  output = "Dockerfile",
  pkg = get_golem_wd(),
  from = paste0("rocker/r-ver:", R.Version()$major, ".", R.Version()$minor),
  as = NULL,
  sysreqs = TRUE,
  repos = c(CRAN = "https://cran.rstudio.com/"),
  expand = FALSE,
  open = TRUE,
  update_tar_gz = TRUE,
  build_golem_from_source = TRUE,
  extra_sysreqs = NULL
)

```

Arguments

path	path to the DESCRIPTION file to use as an input.
output	name of the Dockerfile output.
pkg	Path to the root of the package. Default is get_golem_wd().
from	The FROM of the Dockerfile. Default is FROM rocker/r-ver:R.Version()\$major.R.Version()\$minor.
as	The AS of the Dockerfile. Default it NULL.
port	The options('shiny.port') on which to run the App. Default is 80.
host	The options('shiny.host') on which to run the App. Default is 0.0.0.0.
sysreqs	boolean. If TRUE, the Dockerfile will contain sysreq installation.
repos	character. The URL(s) of the repositories to use for options("repos").
expand	boolean. If TRUE each system requirement will have its own RUN line.
open	boolean. Should the Dockerfile be open after creation? Default is TRUE.
update_tar_gz	boolean. If TRUE and build_golem_from_source is also TRUE, an updated tar.gz is created.

build_golem_from_source
 boolean. If TRUE no tar.gz is created and the Dockerfile directly mount the source folder.

extra_sysreqs character vector. Extra debian system requirements. Will be installed with apt-get install.

Value

The `{dockerfiler}` object, invisibly.

Examples

```
# Add a standard Dockerfile
if (interactive()) {
  add_dockerfile()
}
# Add a Dockerfile for ShinyProxy
if (interactive()) {
  add_dockerfile_shinyproxy()
}
# Add a Dockerfile for Heroku
if (interactive()) {
  add_dockerfile_heroku()
}
```

add_fct

Add fct_ and utils_ files

Description

These functions add files in the R/ folder that starts either with `fct_` (short for function) or with `utils_`.

Usage

```
add_fct(
  name,
  module = NULL,
  pkg = get_golem_wd(),
  open = TRUE,
  dir_create = TRUE,
  with_test = FALSE
)

add_utils(
  name,
```

```

    module = NULL,
    pkg = get_golem_wd(),
    open = TRUE,
    dir_create = TRUE,
    with_test = FALSE
)

```

Arguments

name	The name of the file
module	If not NULL, the file will be module specific in the naming (you don't need to add the leading mod_).
pkg	Path to the root of the package. Default is get_golem_wd().
open	Should the created file be opened?
dir_create	Creates the directory if it doesn't exist, default is TRUE.
with_test	should the module be created with tests?

Value

The path to the file, invisibly.

add_js_file

*Create Files***Description**

These functions create files inside the `inst/app` folder.

Usage

```

add_js_file(
  name,
  pkg = get_golem_wd(),
  dir = "inst/app/www",
  open = TRUE,
  dir_create = TRUE,
  with_doc_ready = TRUE,
  template = golem::js_template,
  ...
)

add_js_handler(
  name,
  pkg = get_golem_wd(),
  dir = "inst/app/www",
  open = TRUE,

```

```
dir_create = TRUE,
template = golem::js_handler_template,
...
)

add_js_input_binding(
  name,
  pkg = get_golem_wd(),
  dir = "inst/app/www",
  open = TRUE,
  dir_create = TRUE,
  initialize = FALSE,
  dev = FALSE,
  events = list(name = "click", rate_policy = FALSE)
)

add_js_output_binding(
  name,
  pkg = get_golem_wd(),
  dir = "inst/app/www",
  open = TRUE,
  dir_create = TRUE
)

add_css_file(
  name,
  pkg = get_golem_wd(),
  dir = "inst/app/www",
  open = TRUE,
  dir_create = TRUE,
  template = golem::css_template,
  ...
)

add_sass_file(
  name,
  pkg = get_golem_wd(),
  dir = "inst/app/www",
  open = TRUE,
  dir_create = TRUE,
  template = golem::sass_template,
  ...
)

add_html_template(
  name = "template.html",
  pkg = get_golem_wd(),
  dir = "inst/app/www",
```

```

    open = TRUE,
    dir_create = TRUE
  )

add_ui_server_files(pkg = get_golem_wd(), dir = "inst/app", dir_create = TRUE)

```

Arguments

name	The name of the module.
pkg	Path to the root of the package. Default is <code>get_golem_wd()</code> .
dir	Path to the dir where the file will be created.
open	Should the created file be opened?
dir_create	Creates the directory if it doesn't exist, default is TRUE.
with_doc_ready	For JS file - Should the default file include <code>\$(document).ready()</code> ?
template	Function writing in the created file. You may overwrite this with your own template function.
...	Arguments to be passed to the template function.
initialize	For JS file - Whether to add the initialize method. Default to FALSE. Some JavaScript API require to initialize components before using them.
dev	Whether to insert <code>console.log</code> calls in the most important methods of the binding. This is only to help building the input binding. Default is FALSE.
events	List of events to generate event listeners in the subscribe method. For instance, <code>list(name = c("click", "keyup"), rate_policy = c(FALSE, TRUE))</code> . The list contains names and rate policies to apply to each event. If a rate policy is found, the debounce method with a default delay of 250 ms is applied. You may edit manually according to https://shiny.rstudio.com/articles/building-inputs.html

Value

The path to the file, invisibly.

Note

`add_ui_server_files` will be deprecated in future version of `{golem}`

See Also

[js_template](#), [js_handler_template](#), and [css_template](#)

`add_module`*Create a module*

Description

This function creates a module inside the R/ folder, based on a specific module structure. This function can be used outside of a `{golem}` project.

Usage

```
add_module(
  name,
  pkg = get_golem_wd(),
  open = TRUE,
  dir_create = TRUE,
  fct = NULL,
  utils = NULL,
  js = NULL,
  js_handler = NULL,
  export = FALSE,
  module_template = golem::module_template,
  with_test = FALSE,
  ...
)
```

Arguments

<code>name</code>	The name of the module.
<code>pkg</code>	Path to the root of the package. Default is <code>get_golem_wd()</code> .
<code>open</code>	Should the created file be opened?
<code>dir_create</code>	Creates the directory if it doesn't exist, default is TRUE.
<code>fct</code>	If specified, creates a <code>mod_fct</code> file.
<code>utils</code>	If specified, creates a <code>mod_utils</code> file.
<code>js, js_handler</code>	If specified, creates a module related JavaScript file.
<code>export</code>	Should the module be exported? Default is FALSE.
<code>module_template</code>	Function that serves as a module template.
<code>with_test</code>	should the module be created with tests?
<code>...</code>	Arguments to be passed to the <code>module_template</code> function.

Value

The path to the file, invisibly.

Note

This function will prefix the name argument with mod_.

See Also

[module_template\(\)](#)

add_resource_path *Add resource path*

Description

Add resource path

Usage

```
add_resource_path(prefix, directoryPath, warn_empty = FALSE)
```

Arguments

prefix	The URL prefix (without slashes). Valid characters are a-z, A-Z, 0-9, hyphen, period, and underscore. For example, a value of 'foo' means that any request paths that begin with '/foo' will be mapped to the given directory.
directoryPath	The directory that contains the static resources to be served.
warn_empty	Boolean. Default is FALSE. If TRUE display message if directory is empty.

Value

Used for side effects.

add_rstudioconnect_file
Add an app.R at the root of your package to deploy on RStudio Connect

Description

Add an app.R at the root of your package to deploy on RStudio Connect

Usage

```
add_rstudioconnect_file(pkg = get_golem_wd(), open = TRUE)  
  
add_shinyappsi0_file(pkg = get_golem_wd(), open = TRUE)  
  
add_shinyserver_file(pkg = get_golem_wd(), open = TRUE)
```

Arguments

<code>pkg</code>	Path to the root of the package. Default is <code>get_golem_wd()</code> .
<code>open</code>	Should the created file be opened?

Value

The path to the file, invisibly.

Note

In previous versions, this function was called `add_rconnect_file`.

Examples

```
# Add a file for Connect
if (interactive()) {
  add_rstudioconnect_file()
}
# Add a file for Shiny Server
if (interactive()) {
  add_shinyserver_file()
}
# Add a file for Shinyapps.io
if (interactive()) {
  add_shinyappsi0_file()
}
```

amend_golem_config Amend golem config file

Description

Amend golem config file

Usage

```
amend_golem_config(
  key,
  value,
  config = "default",
  pkg = get_golem_wd(),
  talkative = TRUE
)
```

Arguments

key	key of the value to add in config
value	Name of value (NULL to read all values)
config	Name of configuration to read from. Defaults to the value of the R_CONFIG_ACTIVE environment variable ("default" if the variable does not exist).
pkg	Path to the root of the package. Default is get_golem_wd().
talkative	Should the messages be printed to the console?

Value

Used for side effects.

app_prod	<i>Is the app in dev mode or prod mode?</i>
----------	---

Description

Is the app in dev mode or prod mode?

Usage

```
app_prod()  
app_dev()
```

Value

TRUE or FALSE depending on the status ofgetOption("golem.app.prod")
A boolean.

browser_button	<i>Insert an hidden browser button</i>
----------------	--

Description

See <https://rtask.thinkr.fr/a-little-trick-for-debugging-shiny/> for more context.

Usage

```
browser_button()
```

Value

Used for side effects. Prints the code to the console.

<code>bundle_resources</code>	<i>Automatically serve golem external resources</i>
-------------------------------	---

Description

This function is a wrapper around `htmltools::htmlDependency` that automatically bundles the CSS and JavaScript files in `inst/app/www` and which are created by `golem::add_css_file()`, `golem::add_js_file()` and `golem::add_js_handler()`.

Usage

```
bundle_resources(
  path,
  app_title,
  name = "golem_resources",
  version = "0.0.1",
  meta = NULL,
  head = NULL,
  attachment = NULL,
  package = NULL,
  all_files = TRUE,
  app_builder = "golem",
  with_sparkles = FALSE
)
```

Arguments

<code>path</code>	The path to the folder where the external files are located.
<code>app_title</code>	The title of the app, to be used as an application title.
<code>name</code>	Library name
<code>version</code>	Library version
<code>meta</code>	Named list of meta tags to insert into document head
<code>head</code>	Arbitrary lines of HTML to insert into the document head
<code>attachment</code>	Attachment(s) to include within the document head. See Details.
<code>package</code>	An R package name to indicate where to find the <code>src</code> directory when <code>src</code> is a relative path (see resolveDependencies()).
<code>all_files</code>	Whether all files under the <code>src</code> directory are dependency files. If <code>FALSE</code> , only the files specified in <code>script</code> , <code>stylesheet</code> , and <code>attachment</code> are treated as dependency files.
<code>app_builder</code>	The name of the app builder to add as a meta tag. Turn to <code>NULL</code> if you don't want this meta tag to be included.
<code>with_sparkles</code>	C'est quand que tu vas mettre des paillettes dans ma vie Kevin?

Details

This function also preload `activate_js()` which allows to use preconfigured JavaScript functions via `invoke_js()`.

Value

an htmlDependency

cat_dev	<i>Functions already made dev dependent</i>
---------	---

Description

This functions will be run only if `golem::app_dev()` returns TRUE.

Usage

```
cat_dev(...)  
print_dev(...)  
message_dev(...)  
warning_dev(...)  
browser_dev(...)
```

Arguments

... R objects (see ‘Details’ for the types of objects allowed).

Value

A modified function.

create_golem	<i>Create a package for a Shiny App using {golem}</i>
--------------	---

Description

Create a package for a Shiny App using {golem}

Usage

```
create_golem(
  path,
  check_name = TRUE,
  open = TRUE,
  overwrite = FALSE,
  package_name = basename(path),
  without_comments = FALSE,
  project_hook = golem::project_hook,
  with_git = FALSE,
  ...
)
```

Arguments

<code>path</code>	Name of the folder to create the package in. This will also be used as the package name.
<code>check_name</code>	Should we check that the package name is correct according to CRAN requirements.
<code>open</code>	Boolean. Open the created project?
<code>overwrite</code>	Boolean. Should the already existing project be overwritten ?
<code>package_name</code>	Package name to use. By default, golem uses <code>basename(path)</code> . If <code>path == '.'</code> & <code>package_name</code> is not explicitly set, then <code>basename(getwd())</code> will be used.
<code>without_comments</code>	Boolean. Start project without golem comments
<code>project_hook</code>	A function executed as a hook after project creation. Can be used to change the default <code>{golem}</code> structure. to override the files and content. This function is executed just after the project is created.
<code>with_git</code>	Boolean. Initialize git repository
<code>...</code>	Arguments passed to the <code>project_hook()</code> function.

Value

The path, invisibly.

Note

For compatibility issue, this function turns `options(shiny.autoload.r)` to FALSE. See <https://github.com/ThinkR-open/golem/issues/468> for more background.

detach_all_attached *Detach all attached package*

Description

Detach all attached package

Usage

```
detach_all_attached()
```

Value

TRUE, invisibly.

disable_autoload *Disabling Shiny Autoload of R Scripts*

Description

Disabling Shiny Autoload of R Scripts

Usage

```
disable_autoload(pkg = get_golem_wd())
```

Arguments

pkg Path to the root of the package. Default is `get_golem_wd()`.

Value

The path to the file, invisibly.

Examples

```
if (interactive()) {  
  disable_autoload()  
}
```

`document_and_reload` *Document and reload your package*

Description

This function calls `rstudioapi::documentSaveAll()`, `roxygen2::roxygenise()` and `pkgload::load_all()`.

Usage

```
document_and_reload(
  pkg = get_golem_wd(),
  roclets = NULL,
  load_code = NULL,
  clean = FALSE,
  export_all = FALSE,
  helpers = FALSE,
  attach_testthat = FALSE,
  ...
)
```

Arguments

<code>pkg</code>	Path to the root of the package. Default is <code>get_golem_wd()</code> .
<code>roclets</code>	Character vector of roclet names to use with package. The default, <code>NULL</code> , uses the <code>roxygen roclets</code> option, which defaults to <code>c("collate", "namespace", "rd")</code> .
<code>load_code</code>	A function used to load all the R code in the package directory. The default, <code>NULL</code> , uses the strategy defined by the <code>load</code> roxygen option, which defaults to <code>load_pkgload()</code> . See <code>load</code> for more details.
<code>clean</code>	If <code>TRUE</code> , roxygen will delete all files previously created by roxygen before running each roclet.
<code>export_all</code>	If <code>TRUE</code> (the default), export all objects. If <code>FALSE</code> , export only the objects that are listed as exports in the NAMESPACE file.
<code>helpers</code>	if <code>TRUE</code> loads testthat test helpers.
<code>attach_testthat</code>	If <code>TRUE</code> , attach testthat to the search path, which more closely mimics the environment within test files.
<code>...</code>	Other arguments passed to <code>pkgload::load_all()</code>

Value

Used for side-effects

expect_shinytag	<i>Test helpers</i>
-----------------	---------------------

Description

These functions are designed to be used inside the tests in your Shiny app package.

Usage

```
expect_shinytag(object)

expect_shinytaglist(object)

expect_html_equal(ui, html, ...)

expect_running(sleep, R_path = NULL)
```

Arguments

object	the object to test
ui	output of an UI function
html	deprecated
...	arguments passed to <code>testthat::expect_snapshot()</code>
sleep	number of seconds
R_path	path to R. If NULL, the function will try to guess where R is.

Value

A `testthat` result.

Examples

```
expect_shinytag(shiny::tags$span("1"))
expect_shinytaglist(shiny::tagList(1))
```

fill_desc	<i>Fill your description</i>
-----------	------------------------------

Description

Fill your description

Usage

```
fill_desc(
  pkg_name,
  pkg_title,
  pkg_description,
  author_first_name,
  author_last_name,
  author_email,
  author_orcid = NULL,
  repo_url = NULL,
  pkg = get_golem_wd()
)
```

Arguments

<code>pkg_name</code>	The name of the package
<code>pkg_title</code>	The title of the package
<code>pkg_description</code>	Description of the package
<code>author_first_name</code>	First Name of the author
<code>author_last_name</code>	Last Name of the author
<code>author_email</code>	Email of the author
<code>author_orcid</code>	ORCID of the author
<code>repo_url</code>	URL (if needed)
<code>pkg</code>	Path to look for the DESCRIPTION. Default is <code>get_golem_wd()</code> .

Value

The desc object, invisibly.

<code>get_golem_options</code>	<i>Get all or one golem options</i>
--------------------------------	-------------------------------------

Description

This function is to be used inside the server and UI from your app, in order to call the parameters passed to `run_app()`.

Usage

```
get_golem_options(which = NULL)
```

Arguments

which NULL (default), or the name of an option

Value

The value of the option.

Examples

```
## Not run:

# Define and use golem_options

# 1. Pass parameters to `run_app`

# to set default value, edit run_app like this :
run_app <- function(
  title = "this",
  content = "that"
) {
  with_golem_options(
    app = shinyApp(
      ui = app_ui,
      server = app_server
    ),
    golem_opts = list(
      p1 = p1,
      p3 = p3
    )
  )
}

# 2. Get the values from the UI side

h1(get_golem_options("title"))

# 3. Get the value from the server-side

output$param <- renderPrint({
  paste("param p2 = ", get_golem_options("p2"))
})

## End(Not run)
```

Description

This function retrieves information about the system requirements using the <https://sysreqs.r-hub.io> API. This function is now deprecated, and was moved to dockerfiler.

Usage

```
get_sysreqs(packages, quiet = TRUE, batch_n = 30)
```

Arguments

packages	character vector. Packages names.
quiet	Boolean. If TRUE the function is quiet.
batch_n	numeric. Number of simultaneous packages to ask.

Value

A vector of system requirements.

golem	<i>A package for building Shiny App</i>
-------	---

Description

Read more about building big shiny apps at <https://engineering-shiny.org/>.

is_running	<i>Is the running app a golem app?</i>
------------	--

Description

Note that this will return TRUE only if the application has been launched with `with_golem_options()`

Usage

```
is_running()
```

Value

TRUE if the running app is a {golem} based app, FALSE otherwise.

A boolean.

Examples

```
is_running()
```

js_handler_template	<i>Golem's default custom templates</i>
---------------------	---

Description

These functions do not aim at being called as is by users, but to be passed as an argument to the `add_js_handler()` function.

Usage

```
js_handler_template(path, name = "fun", code = " ")
js_template(path, code = " ")
css_template(path, code = " ")
sass_template(path, code = " ")
```

Arguments

path	The path to the JS script where this template will be written.
name	Shiny's custom handler name.
code	JavaScript code to be written in the function.

Value

Used for side effect

See Also

[add_js_handler\(\)](#)

`make_dev`

Make a function dependent to dev mode

Description

The function returned will be run only if `golem::app_dev()` returns TRUE.

Usage

`make_dev(fun)`

Arguments

<code>fun</code>	A function
------------------	------------

Value

Used for side-effects

`module_template`

Golem Module Template Function

Description

Module template can be used to extend golem module creation mechanism with your own template, so that you can be even more productive when building your `{shiny}` app. Module template functions do not aim at being called as is by users, but to be passed as an argument to the `add_module()` function.

Usage

`module_template(name, path, export, ph_ui = " ", ph_server = " ", ...)`

Arguments

name	The name of the module.
path	The path to the R script where the module will be written. Note that this path will not be set by the user but via add_module().
export	Should the module be exported? Default is FALSE.
ph_ui, ph_server	Texts to insert inside the modules UI and server. For advanced use.
...	Arguments to be passed to the module_template function.

Details

Module template functions are a way to define your own template function for module. A template function that can take the following arguments to be passed from add_module():

- name: the name of the module
- path: the path to the file in R/
- export: a TRUE/FALSE set by the export param of add_module()

If you want your function to ignore these parameters, set ... as the last argument of your function, then these will be ignored. See the examples section of this help.

Value

Used for side effect

See Also

[add_module\(\)](#)

Examples

```
if (interactive()) {  
  my_tmpl <- function(name, path, ...) {  
    # Define a template that write to the  
    # module file  
    write(name, path)  
  }  
  golem::add_module(name = "custom", module_template = my_tmpl)  
  
  my_other_tmpl <- function(name, path, ...) {  
    # Copy and paste a file from somewhere  
    file.copy(..., path)  
  }  
  golem::add_module(name = "custom", module_template = my_other_tmpl)  
}
```

project_hook

*Project Hook***Description**

Project hooks allow to define a function run just after {golem} project creation.

Usage

```
project_hook(path, package_name, ...)
```

Arguments

path	Name of the folder to create the package in. This will also be used as the package name.
package_name	Package name to use. By default, golem uses basename(path). If path == '.' & package_name is not explicitly set, then basename(getwd()) will be used.
...	Arguments passed from create_golem(), unused in the default function.

Value

Used for side effects

Examples

```
if (interactive()) {
  my_proj <- function(...) {
    unlink("dev/", TRUE, TRUE)
  }
  create_golem("ici", project_template = my_proj)
}
```

run_dev

*Run run_dev.R***Description**

Run run_dev.R

Usage

```
run_dev(file, pkg = pkgload::pkg_name())
```

Arguments

file	File path to run_dev.R. Defaults to R/run_dev.R.
pkg	Package name to run the file. Defaults to current active package.

Value

Used for side-effect

sanity_check	<i>Sanity check for R files in the project</i>
--------------	--

Description

This function is used check for any ‘browser()“ or commented #TODO / #TOFIX / #BUG in the code

Usage

```
sanity_check(pkg = get_golem_wd())
```

Arguments

`pkg` Path to the root of the package. Default is `get_golem_wd()`.

Value

A DataFrame if any of the words has been found.

set_golem_options	<i>{golem} options</i>
-------------------	------------------------

Description

Set and get a series of options to be used with {golem}. These options are found inside the `golem-config.yml` file, found in most cases inside the `inst` folder.

Usage

```
set_golem_options(  
  golem_name = pkgload::pkg_name(),  
  golem_version = pkgload::pkg_version(),  
  golem_wd = pkgload::pkg_path(),  
  app_prod = FALSE,  
  talkative = TRUE  
)  
  
set_golem_wd(path = pkgload::pkg_path(), talkative = TRUE)  
  
set_golem_name(  
  name = pkgload::pkg_name(),
```

```

path = pkgload::pkg_path(),
talkative = TRUE
)

set_golem_version(
  version = pkgload::pkg_version(),
  path = pkgload::pkg_path(),
  talkative = TRUE
)

get_golem_wd(use_parent = TRUE, path = pkgload::pkg_path())

get_golem_name(
  config = Sys.getenv("R_CONFIG_ACTIVE", "default"),
  use_parent = TRUE,
  path = pkgload::pkg_path()
)

get_golem_version(
  config = Sys.getenv("R_CONFIG_ACTIVE", "default"),
  use_parent = TRUE,
  path = pkgload::pkg_path()
)

```

Arguments

<code>golem_name</code>	Name of the current golem.
<code>golem_version</code>	Version of the current golem.
<code>golem_wd</code>	Working directory of the current golem package.
<code>app_prod</code>	Is the <code>{golem}</code> in prod mode?
<code>talkative</code>	Should the messages be printed to the console?
<code>path</code>	The path to set the golem working directory. Note that it will be passed to <code>normalizePath</code> .
<code>name</code>	The name of the app
<code>version</code>	The version of the app
<code>use_parent</code>	TRUE to scan parent directories for configuration files if the specified config file isn't found.
<code>config</code>	Name of configuration to read from. Defaults to the value of the <code>R_CONFIG_ACTIVE</code> environment variable ("default" if the variable does not exist).

Value

Used for side-effects for the setters, and values from the config in the getters.

Set Functions

- `set_golem_options()` sets all the options, with the defaults from the functions below.
- `set_golem_wd()` defaults to `here::here()`, which is the package root when starting a golem.
- `set_golem_name()` defaults `pkgload::pkg_name()`
- `set_golem_version()` defaults `pkgload::pkg_version()`

Get Functions

Reads the information from `golem-config.yml`

- `get_golem_wd()`
- `get_golem_name()`
- `get_golem_version()`

`use_external_js_file` *Use Files*

Description

These functions download files from external sources and put them inside the `inst/app/www` directory. The `use_internal_` functions will copy internal files, while `use_external_` will try to download them from a remote location.

Usage

```
use_external_js_file(  
  url,  
  name,  
  pkg = get_golem_wd(),  
  dir = "inst/app/www",  
  open = FALSE,  
  dir_create = TRUE  
)  
  
use_external_css_file(  
  url,  
  name,  
  pkg = get_golem_wd(),  
  dir = "inst/app/www",  
  open = FALSE,  
  dir_create = TRUE  
)  
  
use_external_html_template(  
  url,
```

```
name = "template.html",
pkg = get_golem_wd(),
dir = "inst/app/www",
open = FALSE,
dir_create = TRUE
)

use_external_file(
  url,
  name,
  pkg = get_golem_wd(),
  dir = "inst/app/www",
  open = FALSE,
  dir_create = TRUE
)

use_internal_js_file(
  path,
  name,
  pkg = get_golem_wd(),
  dir = "inst/app/www",
  open = FALSE,
  dir_create = TRUE
)

use_internal_css_file(
  path,
  name,
  pkg = get_golem_wd(),
  dir = "inst/app/www",
  open = FALSE,
  dir_create = TRUE
)

use_internal_html_template(
  path,
  name = "template.html",
  pkg = get_golem_wd(),
  dir = "inst/app/www",
  open = FALSE,
  dir_create = TRUE
)

use_internal_file(
  path,
  name,
  pkg = get_golem_wd(),
  dir = "inst/app/www",
```

```
  open = FALSE,  
  dir_create = TRUE  
)
```

Arguments

url	String representation of URL for the file to be downloaded
name	The name of the module.
pkg	Path to the root of the package. Default is <code>get_golem_wd()</code> .
dir	Path to the dir where the file will be created.
open	Should the created file be opened?
dir_create	Creates the directory if it doesn't exist, default is TRUE.
path	String representation of the local path for the file to be implemented (use_file only)

Value

The path to the file, invisibly.

Note

See `?htmltools::htmlTemplate` and <https://shiny.rstudio.com/articles/templates.html> for more information about `htmlTemplate`.

use_favicon	<i>Add a favicon to your shinyapp</i>
-------------	---------------------------------------

Description

This function adds the favicon from ico to your shiny app.

Usage

```
use_favicon(path, pkg = get_golem_wd(), method = "curl")  
  
remove_favicon(path = "inst/app/www/favicon.ico")  
  
favicon(  
  ico = "favicon",  
  rel = "shortcut icon",  
  resources_path = "www",  
  ext = "ico"  
)
```

Arguments

<code>path</code>	Path to your favicon file (.ico or .png)
<code>pkg</code>	Path to the root of the package. Default is <code>get_golem_wd()</code> .
<code>method</code>	Method to be used for downloading files, 'curl' is default see utils::download.file() .
<code>ico</code>	path to favicon file
<code>rel</code>	rel
<code>resources_path</code>	prefix of the resource path of the app
<code>ext</code>	the extension of the favicon

Value

Used for side-effects.

An HTML tag.

Examples

```
if (interactive()) {
  use_favicon()
  use_favicon(path = "path/to/your/favicon.ico")
}
```

<code>use_module_test</code>	<i>Add a test file for a module</i>
------------------------------	-------------------------------------

Description

Add a test file for in module, with the new testServer structure.

Usage

```
use_module_test(name, pkg = get_golem_wd(), open = TRUE)
```

Arguments

<code>name</code>	The name of the module.
<code>pkg</code>	Path to the root of the package. Default is <code>get_golem_wd()</code> .
<code>open</code>	Should the created file be opened?

Value

Used for side effect. Returns the path invisibly.

use_recommended_deps *Add recommended elements*

Description

use_recommended_deps Adds shiny, DT, attempt, glue, golem, htmltools to dependencies

use_recommended_tests Adds a test folder and copy the golem tests

Usage

```
use_recommended_deps(  
  pkg = get_golem_wd(),  
  recommended = c("shiny", "DT", "attempt", "glue", "htmltools", "golem")  
)  
  
use_recommended_tests(  
  pkg = get_golem_wd(),  
  spellcheck = TRUE,  
  vignettes = TRUE,  
  lang = "en-US",  
  error = FALSE  
)
```

Arguments

pkg	Path to the root of the package. Default is get_golem_wd().
recommended	A vector of recommended packages.
spellcheck	Whether or not to use a spellcheck test.
vignettes	Logical, TRUE to spell check all rmd and rnw files in the vignettes/ folder.
lang	Preferred spelling language. Usually either "en-US" or "en-GB".
error	Logical, indicating whether the unit test should fail if spelling errors are found. Defaults to FALSE, which does not error, but prints potential spelling errors

Value

Used for side-effects.

use_utils_ui*Use the utils files***Description**

use_utils_ui Copies the golem_utils_ui.R to the R folder.

use_utils_server Copies the golem_utils_server.R to the R folder.

Usage

```
use_utils_ui(pkg = get_golem_wd(), with_test = FALSE)

use_utils_test_ui(pkg = get_golem_wd())

use_utils_server(pkg = get_golem_wd(), with_test = FALSE)

use_utils_test_ui(pkg = get_golem_wd())

use_utils_test_server(pkg = get_golem_wd())
```

Arguments

pkg	Path to the root of the package. Default is <code>get_golem_wd()</code> .
with_test	should the module be created with tests?

Value

Used for side-effects.

with_golem_options*Add Golem options to a Shiny App***Description**

You'll probably never have to write this function as it is included in the golem template created on launch.

Usage

```
with_golem_options(app, golem_opts, print = FALSE)
```

Arguments

app	the app object.
golem_opts	A list of Options to be added to the app
print	Whether or not to print the app. Default is to FALSE, which should be what you need 99.99% of the time In case you need to actively print the app object, you can set it to TRUE.

Value

a shiny.appObj object
