Title Algebraic Tools for the Analysis of Multiple Social Networks

Description Algebraic procedures for the analysis of multiple social networks are delivered with this package as described in Ostoic (2020) <DOI:10.18637/jss.v092.i11>. Among other things, it makes it possible to create and manipulate multiplex, multimode, and multilevel network data with different formats. There are effective ways available to treat multiple networks with routines that combine algebraic systems like the partially ordered semigroup or the semiring structure with the relational bundles occurring in different types of multivariate network data sets. It also provides an algebraic approach for affiliation networks through Galois derivations between families of the pairs of subsets in the two domains.

 Algebraic Tools for the Analysis of Multiple Social Networks

## **Description**

One of the aims of the **multiplex** package is to meet the necessity to count with an analytic tool specially designed for social networks with relations at different levels. In this sense, **multiplex** relies on functions to model the local role algebras of the network based on simple and compound relations existing in the system. It also provides a procedure for the construction and analysis of signed networks through the semiring structure, and it is possible to obtain the different relational patterns at the dyadic level in the system, which can serve for further analysis with diverse types of structural theories.

In conjunction with the **multigraph** package, it is possible to visualize multiplex, multimodal, and multilevel structures as graphs or valued graphs.

#### **Details**

Package: multiplex Type: Package Version: 2.9.8

Date: 9 February 2022

License: GPL-3 LazyLoad: yes

To work with **multiplex**, we typically start with a specific algebraic structure. A *semigroup* is a closed system made of a set of elements and an associative operation on it. The semigroup function constructs this algebraic structure, and it takes an array of (usually but not necessarily) multiple binary relations, which are the generator relations. The Word Table and the Edge Table serve to describe the semigroup completely, and they are constructed with the functions wordT and edgeT, respectively. The strings function gives unique relations of the complete semigroup and the partial order function specifies the ordering of the string elements in the semigroup. For the visualization of the partial order structure, the function diagram produces the lattice of inclusions of a structure having ordered relations.

Different forms of decomposition that allow reducing semigroups such as factorization or finding congruence classes by substitution and the decomposition is based on congruence with the function cngr or  $\pi$ -relations of the unique strings given by fact or imported from *Pacnet*. In these two cases, pi.rels, and decomp will do this job for reducing either for an abstract or a partially ordered semigroup structure.

It is also possible to take the attributes of the actors in the analysis of multiple networks with different forms to incorporate this kind of information to the existing relational structures. In this

4 multiplex-package

case, for example, the network exposure of the actors is in the context of multiple networks, or else the resulted algebraic structures can embed the actor attributes.

In addition, it is possible to analyze structural balance in signed networks, which are built by function signed, through the algebraic structure of the semiring. A semiring is an algebraic structure that combines an abstract semigroup with identity under multiplication and a commutative monoid under addition. The semiring function is capable of performing both balance and cluster semiring either with cycles or with semicycles.

Other capabilities of **multiplex** are not strictly algebraic. For instance, the dichot function serves to dichotomize the input data with a specified cut-off value, rm.isol removes isolated nodes, and the perm function performs an automorphism of the elements in the representative array. All these functions are built for multiple networks represented by high dimensional structures that can be constructed by the function zbind.

The **multiplex** package creates a Relation-Box with the rbox function to implement the Partial Structural or Compositional Equivalence expressed in the cumulated person hierarchy of the system calculated via the cph function. It is from this structure that the partition of multiple networks is possible by counting the multiplicity of their ties.

Relational bundles are identified through the bundles function, which provides lists of pair relations. The transf function serves to transform such data into a matrix form. The enumeration of the different bundle classes is given by bundle. census. An advantage of counting with the bundle patterns is that the different types of bundles serve to establish a system inside the network, in which it is possible to measure the network exposure in multivariate relational systems. Such features can be realized via the rel.sys and expos functions, respectively. Several attributes can be derived by galois, which provides an algebraic approach for two-mode networks.

Finally, multivariate network data can be created through the (s)end (r)eceive (t)ies format that can be loaded and transformed via the read.srt function. Other formats for multiple network data like *Ucinet* dl or *Visone* gml can be imported and exported as well with the multiplex package.

as.semigroup 5

## **Examples**

as.semigroup

Coerce to a Semigroup Object

## **Description**

A generic function for coercing an R object to a semigroup class.

# Usage

```
as.semigroup(x, gens = NA, lbs, numerical, edgeT)
```

## **Arguments**

x an array representing the semigroup

gens array or vector representing the semigroup generators

1bs (optional) label strings for the semigroup

numerical (optional and logical) should the semigroup have numerical format?

edgeT (optional, logical, and experimental) is 'x' an edge table?

## **Details**

Since many of the functions in the multiplex package require an object of the 'Semigroup' class, this function produces this class object from an array representing the semigroup structure.

6 as.signed

## Value

An object of the 'Semigroup' class

ord a number with the dimension of the semigroup st the strings, i.e. a vector of the unique relations

gens the semigroup generators

S the multiplication table of the semigroup

#### Author(s)

## Coerce parts of the signed matrix with two types of relations
as.signed(signed(incubA$IM)$s[1:2,1:2])
```

as.strings

Coerce an Object to a Strings Class

## **Description**

A generic function for coercing an R object to a Rel. Strings class.

## Usage

```
as.strings(x, lbs = NULL)
```

# **Arguments**

x an array; usually with three dimensions of stacked matrices where the multiple

relations are placed.

1bs (optional) the labels of the strings

#### **Details**

This function is useful to proceed with the establishment of the partial order in the strings of relations where the object should be of a 'Strings' class.

## Value

An object of 'Strings' class

wt the word tables

ord the number of unique relations in the semigroup

## Author(s)

arr2 <- round( replace( array(runif(18), c(3,3,2)), array(runif(18),</pre>
        c(3,3,2))>.5, 3)
## bind the data sets
arrs <- zbind(arr1, arr2)</pre>
## make the data a strings object
as.strings(arrs)
```

bundle.census

Bundle Census

## **Description**

A function to perform the Bundle Census in multiple networks.

## Usage

```
bundle.census(x, loops = FALSE)
```

## **Arguments**

an array; usually with three dimensions of stacked matrices where the multiple relations are placed.

(logical) whether or not the loops should be considered

loops

# **Details**

This function calculates the number of occurrences for each bundle class pattern in multiple networks. A bundle is a particular type of pattern made of relations at different levels that is binding a pair of nodes or actors. Depending on the direction and occurrence of each possible tie, then it is possible to count with seven dyadic configuration classes in the census.

bundles 9

## Value

A table with the occurrences in the distinct bundle class patterns. The first column in the output gives the number of bundles in the network, excluding the null pattern, and then the totals for each bundle class pattern are specified in the following columns. The last column of the table hosts loops in case these are activated in the input.

Functions bundles and summaryBundles provide bundle class occurrences in the network with a more detailed information.

bundles, summaryBundles

## **Examples**

bundles

**Bundle Class Patterns** 

## **Description**

Classify the Bundle class patterns in a system of multiple relations

# Usage

10 bundles

#### **Arguments**

X	an array; usually with three dimensions of stacked matrices where the multiple relations are placed.
loops	(logical) whether or not the loops should be considered as a particular bundle
smpl	(logical) simplify the strings of relations? Default no.
1b21b	(logical) should the labels of the nodes be included in the output? (default yes).
collapse	(logical) collapse the distinct levels of relations in the network? (default no).
sep	(optional) the pair separator for the pairwise relations

#### **Details**

A bundle is a particular type of pattern made of relations at different levels that is binding a pair of nodes or actors in a network of relationships. A bundle class is a dyadic configuration resulting from the mixture of the direction and the types of ties between the nodes or actors. There are in total seven dyadic configuration classes, which are *null*, *asymmetric*, *reciprocal*, *tie entrainment*, *tie exchange*, *mixed*, and the *full* bundle pattern. This function provides detailed information about the bundle class patterns in multiple networks as lists of pair relations among the nodes or actors, except for the 'null' pattern.

In case that the nodes are not labeled, then an identification number will be assigned according to the nodes' location in the array representation and as well when the lb2lb option is set to FALSE. This function assumes that the network is directed, and self ties can also be considered in the output. Long string labels can be simplified with smpl, whereas the collapse option blurs the levels in the strings.

#### Value

An object of 'Rel. Bundles' class with the distinct bundle class patterns.

asym	asymmetric
recp	reciprocal
tent	tie entrainment
txch	tie exchange
mixed	mixed
full	full
loops	loops (if chosen)

#### Note

The input array for this function is always dichotomized, and it is possible to obtain the total number of occurrences in each bundle class pattern with the bundle.census function.

## Author(s)

Antonio Rivero Ostoic

cngr 11

## References

Ostoic, J. A. R. 'Dyadic Patterns in Multiple Networks,' *Advances in Social Networks Analysis and Mining, International Conference on*, 475-481. 2011.

## See Also

```
bundle.census, summaryBundles, transf.
```

## **Examples**

cngr

Congruence Relations

## Description

Find the congruence relations of a given abstract or a partially ordered semigroup.

#### Usage

```
cngr(S, P0 = NULL, uniq)
```

#### **Arguments**

S an object from the 'Semigroup' class.

PO (optional) the partial order table

uniq (optional and logical) whether or not return the unique congruence relations

## **Details**

Congruencies are equivalence relations that preserve the operation between the correspondent classes in the algebraic structure. In this case, the different congruence classes are based on the substitution property of the semigroup object.

## Value

An object of 'Congruence' class. The items included are:

S semigroup of relations

PO partial order table (if specified)

clu congruence classes

12 comps

## Note

If the partial order is supplied in the input, then the computation of the congruence classes is slightly faster than for an abstract semigroup.

## Author(s)

Antonio Rivero Ostoic

## References

Hartmanis, J. and R.E. Stearns *Algebraic Structure Theory of Sequential Machines*. Prentice-Hall. 1966.

# See Also

```
decomp, fact, pacnet
```

## **Examples**

comps

Find components in multiple networks

## Description

Function to find different components in the multiple network including isolates

# Usage

```
comps(x, bonds = c("entire", "strong", "weak"))
```

## Arguments

x array representing the network

bonds the type of bonds to be used in the creation of the relational system for the

different components

cph 13

## **Details**

The network's different components are obtained through the transitive closure of the bundle ties. By default, the "entire" system is chosen, but the option bonds allow discriminating different types of relational bundles for the components.

## Value

A list with two possible "components"

```
com a component isol the isolates
```

## Author(s)

Antonio Rivero Ostoic

## See Also

```
bundles, rel.sys
```

# **Examples**

cph

Cumulated Person Hierarchy

# Description

A function to calculate the Cumulated Person Hierarchy in networks of multiple relations

# Usage

```
cph(W, lbs)
```

## **Arguments**

```
an object of the 'Rel.Box' class.
```

1bs (optional) the labels of the relational system

14 cph

## **Details**

The cumulated person hierarchy is used to determine the partial structural equivalence among the actors in a multiple network. Two nodes are considered as *partial structural equivalent* iff they have identical role sets.

The outcome of this function depends on the characteristics of the Relation-Box.

#### Value

An object of 'Partial. Order' class with an array representing the cumulated person hierarchy.

#### Note

If the length of the labels differs from the order of the relational system, then labels will be ignored.

## Author(s)

Antonio Rivero Ostoic

rb <- rbox(incubA$IM)

## Calculate the cumulated person hierarchy
cph(rb)</pre>
```

decomp 15

d	ecomp	Decomposition of a Semigroup Structure

## **Description**

A function to perform the decomposition of a semigroup structure

## Usage

```
decomp(S, pr, type = c("mca", "pi", "at", "cc"), reduc, fac, force)
```

## **Arguments**

S	an object of a 'Semigroup' class
pr	either an object of a 'Congruence' class or an object of a 'Pi.rels' class
type	whether the reduction is based on a a congruence class (option "cc") or rather on a $\pi$ -relation ("pi"), atoms (option "at"), or a meet-complement of atoms (option "mca") in the 'Pi.rels' class
reduc	(optional and logical) does the return object should include the reduced structures?
fac	(optional) the factor that should be decomposed
force	(optional and logical) force further reduction of the semigroup when S has NAs? (see details)

## **Details**

The decomp function performs a reduction of an algebraic structure like the semigroup that verifies which of the class members in the system are congruent to each other. The decomposed object then is made of congruent elements, which form part of the lattice of congruence classes in the algebraic structure. In case that the input data comes from the Pacnet program, then such elements are in the form of  $\pi$ -relations or the meet-complements of the atoms. Otherwise, these are simply equivalent elements satisfying the substitution property.

Sometimes a 'Semigroup' class object contains not available data in the multiplication table, typically when it is an image from the fact function. In such a case, it is possible to perform a reduction of the semigroup structure with the force option, which performs additional equations to the string relations in order to get rid of NAs in the semigroup data.

#### Value

An object of 'Decomp' class having:

clu	vector with the class membership
eq	the equations in the decomposition
IM	(optional) the image matrices
P0	(optional) the partial order table
ord	(optional) a vector with the order of the image matrices

16 diagram

## Note

Reduction of the partial order table should be made by the reduc function.

## Author(s)

Antonio Rivero Ostoic

diagram

Plot a Hasse Diagram of a set of ordered relations

# Description

A function to plot a Hasse Diagram of partially ordered relations.

## Usage

# Arguments

X	a matrix representing ordered relations
attrs	(optional) attributes of the diagram
main	(optional) title of the diagram
incmp	(optional and logical) whether or not the incomparable elements should be included in the lattice diagram
cex.main	(optional) size of the diagram's title
bg	(optional) the background color of the diagram
mar	(optional) the margins of the plot
shape	(optional) the shape of the vertices
col	(optional) the color of the vertices
col0	(optional) the color of the vertices' contour
fcol	(optional) the color of the text's vertices

diagram 17

ecol	(optional) the color of the edges
lty	(optional) the shape of the edges
lbs	(optional) labels of the elements in the partially ordered set
ffamily	(optional) the font family of the vertex labels
fstyle	(optional) the font style of the vertex labels with options: 'bold', 'italic', 'bolditalic'
fsize	(optional) the font size of the vertex labels
col.main	(optional) the color of the diagram's title
sep	(optional, only for 'lbs') string separator for equations
	(optional) additional graphical items

#### **Details**

An example of ordered relations is found in the partial order table of relations, which is product of the 'strings' option in the partial.order function. Another set of ordered relations comes from the table produced on Galois derivations in the mentioned function. In either case this function plot either the partial order or a linear order diagram, depending on the results as Hasse diagrams.

When the partial order structure is from a decomposition process, string equations can be placed as labels with an equality separator.

#### Value

A Hasse diagram of the partial order relation.

## Warning

This function requires that the *Rgraphviz* package is available.

## Note

Roman numerals are used if the elements of the partial order are not labelled.

# Author(s)

Antonio Rivero Ostoic

## See Also

```
partial.order, as. strings, strings, diagram.levels, galois.
```

## **Examples**

```
## load the data
data("incubA")

## given e.g. a partial order table in the object 'po'
po <- partial.order(as.strings(incubA$IM), type="strings")</pre>
```

18 diagram.levels

```
## plot the order relation as a Hasse diagram.
## Not run: if(require(Rgraphviz)) {
plot(diagram(po))
}
## End(Not run)
```

diagram.levels

Levels in the Lattice Diagram

## Description

This function reads the different levels in the lattice diagram of the partial order structure among actors and ties in the network.

## Usage

```
diagram.levels(x, perm = FALSE)
```

## **Arguments**

x A matrix representing the partial order
perm (optional) whether or not to return the permuted structure

#### **Details**

When it comes to reduce the structure of a multiple network, many times the partial order structure provides different classes of elements depending in the inclusions these elements have. In this sense, the illustration given by the diagram function provides us typically with different levels of the ordered relations, which are read by this routine.

## Value

A data frame with the elements of the partial order structure with the column names indicating the element class. If the permutation is specified, then a vector with the levels and a matrix with the permuted structure are given as well.

## Note

This function requires that the *Rgraphviz* package is available. Besides, since the pictex function from grDevices is inside this routine, it implies counting with administrator privileges for running.

#### Author(s)

Antonio Rivero Ostoic

## See Also

## find the levels in the lattice diagram
## Not run: diagram.levels(po)</pre>
```

dichot

Dichotomize data with a cutoff

## **Description**

Function to dichotomize the input data for the semigroup construction with a cutoff value.

## Usage

```
dichot(x, c = 1, diag)
```

## **Arguments**

x some data in a numeric form (usually arrays)
c the cutoff value to perform the dichotomization (default 1)
diag (optional and logical) whether or not the diagonals should be included (default

TRUE)

#### **Details**

This is a convenient function (or wrapper if you like) of the replace function. In this case the function is aimed to specify a cutoff value for the dichotomization of the data where the values equal or higher to the cutoff are converted to one, while the others are set to zero. The cutoff can be any real number.

# Value

Binary values of the input data.

#### Note

The labels are preserved after the dichotomization.

## Author(s)

Antonio Rivero Ostoic

20 edgeT

## See Also

```
replace, prev, semigroup.
```

## **Examples**

edgeT

Edge Table Generator

# Description

The Edge Table generator of multiple relations.

## Usage

```
edgeT(x)
```

## **Arguments**

Х

an array; usually with three dimensions of stacked matrices where the multiple relations are placed.

#### **Details**

The Edge Table is the complete right multiplication table of the semigroup having its elements for each of its generators.

# Value

An object of the 'EdgeTable' class

gens the generator relations ET the Edge Table

Author(s)

Antonio Rivero Ostoic

expos 21

## See Also

```
wordT, semigroup.
```

# **Examples**

expos

Network exposure for multiple networks

# Description

Function to measure the network exposure of the nodes according to a chosen relational system representing the multiple network.

## Usage

```
expos(rs, classes = FALSE, allClasses = FALSE, allNodes = TRUE)
```

# **Arguments**

rs	an object of 'Rel. System', typically with node attributes.
classes	(optional) whether or not should be included in the outputthe categories of adopters
allClasses	(optional) whether or not to include empty classes within the categories of adopters. Ignored if classes is ${\sf FALSE}$
allNodes	(optional) whether or not to include all actors in the network regardless they are in the chosen system. Ignored if classes is FALSE

#### **Details**

This is a generalization of the network exposure measure for multiple networks with the characteristics chosen for the representative relational system. Such system can be the entire network or configuration with strong or weak bonds among the actors. It is possible to specify different behaviors of the nodes representing social actors, which are indicated in the form of a relational system. The network exposure measure is calculated according to the immediate neighbors to the reference actor.

22 fact

## Value

Classes if classes is set to TRUE, the adoption membership for the type of relational

system chosen, including isolated actors in the system.

Bonds the type of bonds of the relational system (cf. rel.sys)

Exposure the exposure to the attribute(s) for acquisition through immediate neighbour re-

lations

fact

Factorization of semigroup structures

## **Description**

A function to decompose partially ordered semigroups

# Usage

```
fact(S, P, uniq = TRUE, fac, atoms, mca, atmc, patm, k)
```

fact 23

# **Arguments**

S	a semigroup object, S
Р	a partial order structure associated to S
uniq	(logical) whether the factorization include the unique induced inclusions
fac	(integer) the 'factor' to be factorized (see details)
atoms	(logical) whether or not include the atoms in the output
mca	(logical) whether or not include the meet-complements of atoms in the output
atmc	(logical) whether or not include the atoms' meet-complements in the output
patm	(logical) whether or not include the potential atoms in the output
k	the length of the induced inclusion (only relevant if patm is activated)

#### **Details**

The factorization is part of the decomposition process for partially ordered semigroups, which means that there are two objects in the input. The induced inclusions are additions to the partial order and, depending on the needs; it is possible to customize the rest of the output. Atoms and meet-complement of these are useful for the decomposition through the decomp that produce a number of reduced structures or 'factors'. Argument fac allows choosing a factor for a progressive factorization.

## Value

An object of "Ind.incl" class having:

ро	the partial order table
iin	list of induced inclusions pairwise listed
niin	length of the induced inclusion
patm	(optional) a vector with the potential atoms
atm	(optional) a vector with the atoms
atmc	(optional) array with meet-complements of atoms
mca	(optional) meet-complements of atoms
note	(optional) induced inclusions without the substitution property

## **Examples**

fltr

Principal filters

## **Description**

A function to find principal filters in a partial order

## Usage

```
fltr(x, PO, ideal = FALSE, rclos)
```

# **Arguments**

X	the reference element in the partial order (integer or character)
PO	the partial order
ideal	(logical) whether or not the "filter" is an ideal
rclos	(optional and logical) apply reflexive closure?

#### **Details**

This function helps to find principal filters or principal ideals for an element in a partial order structure. Such inputs are normally a concept or an object or attribute in the concept together with the associated partial ordering structure of the concepts, which results from Galois derivations. Typically, if the reference element refers to a concept, then it is given as a positive integer indicating the concept label. Another option is to refer an object or an attribute by a character name, which should be part in the labels of the dimensions of the partial order table with a reduced labeling. Principal filters with a full labelling are not allowed if the reference element is an object or an attributes. Use an integer for the concept instead.

galois 25

## Value

A named list with the elements in the upset or downset of the principal filter or ideal corresponding to the reference element in the partial order.

## Author(s)

Antonio Rivero Ostoic

# References

Ganter, B. and R. Wille Formal Concept Analysis - Mathematical Foundations. Springer. 1996.

## See Also

```
galois, partial.order, diagram.
```

# Examples

```
## Create a data frame
dfr <- data.frame(x=1:3, y=5:7)

## Partial ordering of concepts
PO <- partial.order(galois(dfr),"galois")

## Filter for the first element
fltr(1, PO, rclos=TRUE)</pre>
```

galois

Galois derivations between subsets

## **Description**

Function to perform Galois derivations between partially ordered subsets

## Usage

```
galois(x, labeling = c("full", "reduced"), sep, valued, scl,
    sep2)
```

# Arguments

Χ	a data frame with objects and attributes
labeling	whether the derivations should be with full or reduced labeling
sep	(optional) the pair separator for the pairwise relations
valued	(logical) whether the galois derivation is on a many-valued formal context
scl	(optional, only for valued) the scale to be used in the galois derivation
sep2	(optional, only for valued) the separator in the formal concept

26 hierar

## **Details**

Galois derivations (or connections) are mappings between families of partially ordered subsets of elements. Such derivations are useful to analyze the structure of both subsets, which in a social network are typically the actors and their corresponding affiliations or events. That is, two-mode networks, but also a group of objects with a list of different attributes as used in formal concept analysis.

#### Value

A labelled list with Galois derivations of objects and attributes

#### Note

Full labeling implies first objects and then attributes, whereas the reduced option is given the other way around.

## Author(s)

Antonio Rivero Ostoic

#### References

Ganter, B. and R. Wille Formal Concept Analysis - Mathematical Foundations. Springer. 1996.

```

hierar

Person and Relation Hierarchy

# Description

A function to establish either the Person or the Relation Hierarchy in a multiple network

## Usage

```
hierar(W, x, type = c("person", "relation"))
```

hierar 27

## **Arguments**

W	an object of 'Rel.Box'
x	(integer or character) the actor of reference, either by its location in the adjacency matrix or by the label.
type	whether the hierarchy is for the 'persons' or for the 'relations' in the network with respect to 'x'

#### **Details**

The person hierarchy refers to the inclusion relations among the actors, whereas the relation hierarchy refers to the inclusion relations among the ties. Both are from the perspective of a chosen actor of reference in the given network.

## Value

An array that represents the partial order structure of the respective hierarchy.

#### Note

The cumulative person hierarchy is obtained through the cph function.

## Author(s)

Antonio Rivero Ostoic

28 incubs

incubs

Incubator networks dataset

## **Description**

These are four data sets collected in year 2010 (see 'source' for the details) of multiple relations between entrepreneurial firms working in business incubators in Denmark.

Each data set contains the adjacency matrices of the three social relations, coded as C, F, and K for working collaboration, informal friendship, and perceived competition among the firms. There are also two actor attributes corresponding to adoption of two Web innovations in year 2010 by the firms where A stands for Linkedin, and B for Facebook.

In addition, there is a blockmodel attached to each data set that is product of Compositional Equivalence (cf. cph) with transposes for each type of social tie labelled with the following letter in the Latin alphabet; i.e. D for collaboration, G for friendship, and L for perceived competition.

## Usage

```
data("incubs")
data("incubA")
data("incubB")
data("incubC")
data("incubD")
data("incA")
data("incB")
data("incC")
data("incC")
```

#### **Format**

Each data set is a list with a pair of three dimensioanl arrays.

For incubA, the dimensions of net are  $26 \times 26 \times 5$ , and of IM are  $4 \times 4 \times 7$  (the two attributes led to the identity matrix).

For incubB, the dimensions of net are  $18 \times 18 \times 5$ , and of IM are  $4 \times 4 \times 8$ .

For incubC, the dimensions of net are  $22 \times 22 \times 5$ , and of IM are  $3 \times 3 \times 8$ .

For incubD, the dimensions of net are  $15 \times 15 \times 5$ , and of IM are  $4 \times 4 \times 6$ .

All four networks are putted in together in incubs.

In order to plot automatically actor attributes in the graph with function multigraph, another version of these data sets are given in incA, incB, incC, and incD, which are "Data. Set" objects class having:

- net for the network data
- atnet a vector that indicates whether or not the arrays in 'net' is attribute data
- IM for the Image Matrices of the reduced network data
- atIM a vector that indicates whether or not the array in 'IM' is attribute data
- cite relational content of the ties

mlvl Construct multilevel structures

## **Description**

Function to construct multilevel structures from a one- and a two-mode network.

## Usage

```
mlvl(x = NULL, y = NULL, type = c("bpn", "cn", "cn2", "list"),
     symCdm, diag, lbs)
```

# Arguments

x domain data
y codomain data
type type of multilevel structure
symCdm (optional and logical, only for bpn) whether or not symmetrize the codomain structure
diag (optional and logical) whether or not include the entries in the diagonal matrices

lbs (optional, only for cn2) tie labels

# **Details**

The default multilevel structure is bpn that requires data for the two domains. However, option cn does need x since returns the co-affiliation network of the codomain structure.

Many times is convenient to specify the domain and codomain labels. Since these are different components in the multilevel structure, then the components' labels have to be be specified as a list object.

#### Value

An object of 'Multilevel' class of chosen type.

mlnet the multilevel network

lbs (list) domain and codomain labels

modes a vector indicating the domain of the data in mlnet where 1M is for domain and

2 is for the codomain.

## Note

Function may need further testing of exceptions.

30 mnplx

# rectangle array for the co-domain
arr2 <- round( replace( array(runif(12), c(3,2,2)), array(runif(12), c(3,2,2))>.9, 3 ) )
# multilevel structure with default type
mlvl(arr1, arr2)
```

mnplx

Make a multiple network as monoplex structure

## **Description**

A function to transform multiple networks into a monoplex structure

## Usage

```
mnplx(net, directed = TRUE, dichot, diag, clu)
```

## **Arguments**

net a three-dimensional array to be transformed into a matrix directed (optional) whether to make the matrix symmetric or not dichot (optional) should the output be dichotomized? diag (optional) should the diagonals be included?

clu (optional) a vector with the cluster for the permutation

## **Details**

With this function, it is possible to collapse multiple types of tie into a matrix representation with monoplex relations.

## Value

A matrix of monoplex relations

neighb 31

## Author(s)

Antonio Rivero Ostoic

#### See Also

```
zbind, dichot, reduc
```

## **Examples**

neighb

Neighborhood of an actor or group of actors

# Description

A function to find the neighborhood of an actor or group of actors with a customized distance.

## Usage

```
neighb(x, rs, type = c("und", "inn", "out"), k = 1, inclx = FALSE, expand)
```

## **Arguments**

x	the reference actor labeled in rs or a vector of several actors
rs	the relational system of the network
type	whether the network is <i>undirected</i> (default) und; directed with <i>incoming node</i> 's ties inn to the the reference actor, or else with <i>outgoing</i> arcs out
k	the "distance" of the neighbor nodes to the reference actor (where $k=1$ gives the adjacent nodes)
inclx	(logical) should the reference actor be included in the output?
expand	(optional and logical) should the output be given by $k$ (it only makes sense when $k>1$ )

## **Details**

The relational system serves to represent either the entire multiple network, or else just the relational bundles having a mutual or an asymmetric character. In this sense, this function detects the adjacent nodes to x according to the specified relational system, but as well the neighbors of the adjacent nodes with a customized length. Eventually, when the longest path or chain is reached, adding more value to k obviously will not produce more nodes in the graph system.

32 pacnet

## Value

Depending on expand, the output is either a vector or a list with the neighbor nodes to the reference actor(s).

#### Note

In case that the reference actors are in different components of the network, the output does not discriminate this fact.

## Author(s)

Antonio Rivero Ostoic

## See Also

```
expos, rel.sys, bundles
```

# **Examples**

pacnet

Read Output from Pacnet

# Description

A function to read output files from the Pacnet program with the full factorization option.

## Usage

## **Arguments**

file	character vector containing a file name or path
toarray	(logical) should the induced inclusions be transformed into arrays?
uniq	(logical) should only be considered the induced inclusions that are unique?
transp	(logical) should the partially ordered structures be transposed?
sep	(optional) the pair separator for the pairwise relations

partial.order 33

## **Details**

This function is used to read the output file from the Pacnet program, which typically has the .out extension. By default the result is given in a list format, but it is possible to transform the pair lists into arrays. Note that the options in the Pacnet program should include the full factorization in the output; otherwise the object will be NULL.

#### Value

An object of the 'Pacnet' class with items:

ii induced inclusions

at atoms

mc meet complements

#### Note

Currently only partial order structures of order 36 and less are supported.

partial.order

The Partial Order of String relations or of Galois derivations

# **Description**

Construct the partial order table of unique relations of the semigroup, or else of the concepts produced by Galois derivations.

# Usage

34 partial.order

# Arguments

х	an object of a 'Strings' or a 'Galois' class
type	whether the object corresponds to string relations, Galois derivations, or $\pi\text{-}$ relations
lbs	(optional) the labels of the unique relations
sel	(optional) selected elements in 'x' for the partial order
po.incl	(optional, works only with type "pi.rels") should the partial order in the $\pi\text{-}$ relations be included
dichot	(optional) should the string relations in x be dichotomized?

## **Details**

To get the partial order of an entire semigroup, both generators and compound relations must be considered. This information and the labels of the unique relations are given by the strings function. cf. semigroup to see how the x should be specified properly.

Galois derivations are now possible to be partially ordered as well, and this option is based on the output given by the galois function.

#### Value

An object of 'Partial.Order' class with the partial order table in a matrix form.

## Author(s)

Antonio Rivero Ostoic

#### References

```

perm 35

!	
---	--

## **Description**

Function to permutate a given array of relation.

## Usage

```
perm(x, clu, rev, lbs, sort)
```

## **Arguments**

X	a matrix or an array to be permuted
clu	the cluster for the permutation
rev	(optional and logical) whether the order in clu sholud be reverted.
lbs	(optional) the labels after the permutation
sort	(optional and logical) permut the array by sorting dimnames?

## **Details**

This function serves to permutate an array representing relations according to a vector for the clustering membership. By activating the sort argument to TRUE, all other arguments will be ignored.

## Value

A permuted matrix or array

```

36 pfvn

pfvn	Pathfinder valued network and triangle inequality

# Description

A function to establish the skeleton of a valued network with the pathfinder algorithm and triangle inequality

# Usage

```
pfvn(x, r, q)
```

# Arguments

Χ	network data, typically valued
r	a distance function parameter
q	parameter with the minimum distance between actors in the proximity matrix

## **Details**

The Pathfinder structure is for undirected networks, whereas for directed network structures the triangle inequality principle is applied

## Value

max	max value of the network with the Frobenius norm
r	parameter r
q	parameter $q$
Q	salient structure of x
Note	A note when triangle inequality is used

## Author(s)

Antonio Rivero Ostoic

pi.rels

 $\pi$ -Relations

## **Description**

A function to establish the  $\pi$ -relations of a partially ordered structure comming from a 'Pacnet' class

# Usage

```
pi.rels(x, po.incl, vc, po)
```

# Arguments

x an object of a 'Pacnet' class

po.incl (optional and logical) should the partial order be included in the outcome?

vc (optional) vector of the induced inclusions to be computed

(optionar) vector or the madeed metasions to be compe

po (optional) the partial order structure

# **Details**

This function process the outcome of the Pacnet report by adding induced inclusions to partial order, the minimal element of the lattice of congruence relations. Such type of structure serves for the decomposition of a partially ordered semigroup structure.

## Value

An object of the 'Pi.rels' class

pi the  $\pi$ -relations, eventually with the partial order

mca the meet-complements of atoms

prev

Preview of the Semigroup Construction

# **Description**

A function to preview the partial right multiplication table of the semigroup to assess the size of the complete semigroup.

# Usage

prev(x)

# **Arguments**

Х

an array; usually with three dimensions of stacked matrices where the multiple relations are placed.

## **Details**

When the input data is large, i.e. having a dozen or more elements and/or more than five dimensions, it is recommended to perform this function before the semigroup construction in order to get the partial right multiplication table.

That is because the amount of undefined data in such table gives an idea of how much time may take to get the complete semigroup. However the performance depends mainly on whether the generator matrices are sparse and/or have a relative large number of elements for a semigroup construction of course.

# Value

'2stpT' a partial right multiplication table at two-step.
'PcU2stpT' the proportion of undefined elements at two-step.
ordr the dimension of the right multiplication table so far.
Note a conditional warning message.

# Note

The warning message is given only if the percentage of undefined elements and the dimension of the input data are relative high. The semigroup construction can however still take long time without such message; cf. 'Details' for this.

rbox 39

## Author(s)

Antonio Rivero Ostoic

## See Also

```
semigroup, edgeT.
```

# **Examples**

rbox

Construct the Relation-Box

# **Description**

Function to construct the Relation-Box of a multiple network

# Usage

```
rbox(w, transp = FALSE, smpl = FALSE, k = 3, tlbs)
```

# Arguments

W	an array with three dimensions of stacked matrices of generating relations.
transp	(logical) whether or not the transpose of each matrix in $\boldsymbol{w}$ should be included.
smpl	(logical) whether to simplify or not the strings of relations
k	length of the Relation-Box in $z$
tlbs	(optional) a vector with the labels for the transpose relations.

# **Details**

If transp = TRUE the labels of the transpose are toggle case of the labels of the original matrices, and in such case it is adviced to simplify the strings of relations. In order to prevent a transposed structure for a certain array of w, use NA in the vector the transpose labels tlbs corresponding to the respective matrix.

40 rbox

## Value

An object of the 'Rel.Box' class.

W	the primitive relations in the Relation-Box
W	the structure of the Relation-Box
lbs	the labels in the relational system
Note	(optional) Notes indicating the particularities in the input
Orels	the original labels of the relations
Srels	(optional) the simplified labels of the relations
Trels	(optional) the labels of the transposed relations

k the maximal length of the word

z the length of the Relation-Box in the z dimension

## Note

Values of k until 9 is supported. With many types of relations, and when the order of the multiple network is high, turning k to more than three may take a long time of computation.

## End(**Not run**)
```

read.dl 41

read.dl

Read dl Files

# Description

A function to read files with the Ucinet dl format.

# Usage

```
read.dl(file)
```

## **Arguments**

file

character vector containing a file name or path of the data representing the network

## **Details**

Files d1 serve to represent multiple network structures, and it is one of the formats used in Netdraw, which is a component of the Ucinet program. Besides multiple networks, the function can read two-mode structures as well.

#### Value

a data frame for two-mode networks, or an array representing the multiple networks with one set of actors.

# Note

The 'EDGELIST' option in DL is not yet supported for reading.

# Author(s)

Antonio Rivero Ostoic

```

42 read.gml

read.gml	Read gml Files	

# **Description**

A function to read files with the gml format.

## Usage

```
read.gml(file, as = c("srt", "array"), directed = TRUE, coords = FALSE)
```

# **Arguments**

file character vector containing a file name or path

as should the data be given as a srt or with an array format?

directed (logical) whether the graph is directed or undirected.

coords (logical) whether the coordinates in the gml file should be included.

## **Details**

The gml format, an acronym for *graph modelling language*, provides capabilities to represent multiple networks and add arguments to both the nodes and the edges for visualization purposes.

For the multiplexity in the ties, the gml file distinguishes "graphics" arguments inside "edge". Both "style" and "fill" are supported here and the former has priority over the latter in case the two are given; otherwise when these arguments are absent. The function separates up to a couple of relational levels when several pairwise ties are specified.

## Value

Depending the option chosen, the output is either a data frame or an array representing the multigraph. If the coordinates are chosen then these are part of the object structure, but they are not visible.

#### Note

If the coordinates are chosen, node attributes can also be retrieved.

```

read.srt 43

|--|

## **Description**

A function to read files with send, receive, and ties format for a multivariate network with the possibility to transform it into a three dimensional array.

# Usage

```
read.srt(file, header = TRUE, sep = "\t", toarray = TRUE, dichot = FALSE,
    attr = FALSE, rownames = FALSE, add = NULL)
```

# **Arguments**

file	path to the file
header	(logical) does the file has a header?
sep	the separator among the columns (default is horizontal tab)
toarray	(logical) should the data frame be transformed to arrays?
dichot	(logical) should the data be dichotomized?
attr	(logical) whether or not the file corresponds to attribute-based data
rownames	(logical) are rownames the labels of the nodes?
add	(optional) isolates to be added to the network

## **Details**

srt stands for send, receive, and ties, and it is a data frame with at least 3 columns for the sender, receiver, and the ties, one column for each type of relation. However, the attr option correspond to a actor and self-ties data frame file with the option to transform it into a diagonal matrix. When toarray is set to FALSE, options attr and rownames allow placing the first column of the data frame as the name of the table, which is the format of two-mode data, and compute for instance Galois transformations among the partite sets. If more than one isolate is added, then the data must be included as a vector.

It is also possible to treat the input data as data frame object and manipulate it via e.g. the subset function with the toarray option.

# Value

By default an array; usually with three dimensions of stacked matrices where the multiple relations are placed. If toarray = FALSE, then the data frame is given.

# Note

The function supports valued networks as well.

44 reduc

## Author(s)

Antonio Rivero Ostoic

```
write.srt, read.gml, read.dl, galois
```

reduc Reduce a matrix or array

# **Description**

Function to reduce a matrix or array with a given clustering vector

# Usage

```
reduc(x, clu, lbs = NULL, slbs = NULL, valued, row, col)
```

# Arguments

X	a matrix or a three-dimensional array to be reduced
clu	a vector with the class membership
lbs	(optional) the labels to be used in the reduction
slbs	(optional) the string labels to be used in the reduction
valued	(logical) whether the reduction should preserve valued data?
row	(optional) the reduction by rows
col	(optional) the reduction by columns

## **Details**

Given a partition, this function serves to reduce either a matrix representing e.g. a partial order structure. However the reduction is also generalized a three-dimensional arrays representing multiple relations.

# Value

The reduced matrix or a reduced three-dimensional array of the input data according to the clustering information.

## Note

Use decomp for the reduction of a semigroup object.

# Author(s)

Antonio Rivero Ostoic

rel.sys 45

## See Also

```
cngr, rbox, decomp
```

#### **Examples**

```
## scan the multiplication table data s \leftarrow matrix(data=c(1, 1, 1, 3, 3, 3, 3, 3), nrow=3, ncol=3, byrow=TRUE) ## Reduce the multiplication table reduc(s, clu=c(1,2,2))
```

rel.sys

Relational System

## **Description**

Create the Relation System of a multiple network.

## Usage

# **Arguments**

X	an array; usually with three dimensions of stacked matrices where the multiple relations are placed.
type	if the transformation is from (array of) matrices into lists of pairwise relations or vice versa
bonds	the type of bonds to be used in the creation of the relational system (default the 'entire' network)
sel	(optional) the set of actors to be selected. For "toarray" att and noatt also supported (see details)
loops	(logical) whether or not the loops should be considered in the relational system
att	the arrays in x corresponding to attributes
sep	(optional) the pair separator for the pairwise relations

## **Details**

When the type of bonds chosen is entire then the nodes with ties are considered in the relational system without isolated nodes. strong bonds are relational bundles with a mutual character, whereas weak bonds are those pattern exclusively without mutual character.

When selecting from a list with actor attributes, it is also possible to select the network members having or *not* the attribute that is specified in the Attrs output. Use att or noatt for the two options.

46 rel.sys

#### Value

An object of 'Rel. System' class for the type = "tolist" (default) option. The items are:

ord order of the network relational system nodes the nodes in the relational system

sel the selected set of actors

sys.ord the order of the relational system with the chosen bond type

incl the nodes included the relational system with the chosen bond type excl the nodes excluded the relational system with the chosen bond type

bond. type the type of bonds used in the relational system creation

size number of ties in the relational system

Note (optional) note

sep the pairwise separator of the relational system

Ties the ties in the relational system

Attrs.ord if att is not NULL, the number of nodes with the chosen attribute(s)

Attrs if att is not NULL, the actors with the chosen attribute(s)

For type = "toarray" the output is a dichotomous 2D or 3D array recording the relations among the actors in the network.

rm.isol 47

# Description

Function to remove isolate nodes in simple and multiple networks.

# Usage

```
rm.isol(x, diag, diag.incl)
```

# Arguments

Х	a matrix or array representing a network
diag	(optional and logical) if arrays, should the diagonals be included in the computation?
diag.incl	(optional and logical) if arrays, should the diagonals be included in the output?

## **Details**

Isolated nodes do not have any edges in the network, and in a multivariate system, there is no edges adjacent to these kinds of nodes at any level.

# Value

The matrix or array representing a multiple network without the isolated actors.

# Author(s)

Antonio Rivero Ostoic

48 semigroup

semigroup	Constructing the Semigroup of Relations	

## **Description**

Function to create the complete semigroup of multiple relations, where the multiplication table can be specified with either a numerical or a symbolic form.

# Usage

## **Arguments**

Х	an array; usually with three dimensions of stacked matrices where the multiple relations are placed.
type	whether the semigroup should be returned with a numerical (default) or in a symbolic form?
cmps	(optional and logical) a logical to indicate whether the composite matrices should be also given in the output.
smpl	(logical and logical) whether to simplify or not the strings of relations.
valued	(logical) whether the semigroup should be with a valued format

#### **Details**

A multiple relation can be defined by square matrices of 0's and 1's indicating the presence and absence of ties among a set of actors. If there is more than one relation type, the matrices must preserve the label ordering of its elements and stacked into an object array in order to be effectively applied to this function.

The semigroup, which is an algebraic structure having a set with an associative operation on it, is calculated considering binary matrices only. This means that if the provided matrices are valued, the function will dichotomize the input data automatically; values higher or equal to a unit are converted to one, otherwise they are set to zero. If you are not happy with that, you can go to dichot and specify your own cutoff value for the dichotomization.

Semigroup structures for valued relations apply the max min operation in the composition of generators and strings.

#### Value

An object of 'Semigroup' class. The items included are:

gens an array with the generator relations

cmps an array with the unique compound relations ord a number with the dimension of the semigroup

semigroup 49

```
st the strings, i.e. a vector of the unique relations

S the semigroup of relations (see below)
```

If the specified type is 'numerical', then a matrix of semigroup values is given, otherwise the values is returned as a data frame with the strings of the semigroup.

## Warning

For medium size or bigger sets (having e.g. more the 4 relation types), the semigroup construction could take a long time.

#### Note

It is recommendable to perform the function prev before attempting to construct the semigroup, unless the input data has few dimensions.

50 semiring

semiring Semiring Structures for Balance Theory
---

# Description

A function to construct semiring structures for the analysis of structural balance theory.

# Usage

# Arguments

X	an object of a 'Signed' class
type	balance or cluster semiring?
symclos	(logical) apply symmetric closure?
transclos	(logical) apply transitive closure?
k	length of the cycle or the semicycle
lbs	(optional) labels for the semiring output

## **Details**

Semiring structures are based on signed networks, and this function provides the capabilities to handle either the balance semiring or the cluster semiring within the structural balance theory.

A semiring combines two different kinds of operations with a single underlying set, and it can be seen as an abstract semigroup with identity under multiplication and a commutative monoid under addition. Semirings are useful to determinate whether a given signed network is balanced or clusterable. The symmetric closure evaluates this by looking at semicycles in the system; otherwise the evaluation is through closed paths.

## Value

An object of 'Semiring' class. The items included are:

val	the valences in the semiring
S	the original semiring structure
Q	the resulted semiring structure
k	the number of cycles or semicycles

# Note

Disabling transitive closure should be made with good substantial reasons.

signed 51

# **Examples**

signed

Signed Network

# Description

Construct the signed network of a system of contrasting relations

## Usage

```
signed(P, N = NULL, lbs)
```

## **Arguments**

P array with the positive ties and possible with negative ties (see Details)

N (optional) array with the negative ties 1bs (optional) labels for the signed matrix 52 signed

# **Details**

This function coerce an array(s) to become a 'Signed' object. Positive ties are always in the first argument, and in case that this array has three dimensions, the second dimension is considered as the negative ties, provided that N still NULL. If ambivalent ties are present in the structure then the signed matrix represent positive, negative, ambivalent, and null ties as p, n, p, and p respectively; otherwise the values are 1, p1, and p0.

#### Value

An object of 'Signed' class with items:

val the valences in the signed matrix

s the signed matrix

#### Note

A warning message is shown when the N argument has more than two dimensions.

## Make the signed matrix with two types of relations
signed(incubA$IM)
```

strings 53

# **Description**

Function to get the labels of the unique relations of the semigroup; that is the generators and compound relations that are the elements of the complete semigroup.

# Usage

```
strings(x, equat = FALSE, k = 2, smpl, valued)
```

#### **Arguments**

x	an array; usually with three dimensions of stacked matrices where the multiple relations are placed.
equat	(logical) should the equations be included in the output?
k	length of the strings in the equations
smpl	(optional and logical) whether to simplify or not the string relations

valued (logical) whether the strings are with a valued format

## **Details**

The strings are the unique relations, which constitutes the elements of the complete semigroup. These are both the generators and the compound relations after applying the Axiom of Quality, which means that even some generators can be disregarded.

This function is especially useful to construct the partial order of relations, and to establish the set of equations in the relational structure.

# Value

An object of 'Strings' class.

wt the generators and compound relations ord the order of the structure

st the labels of the unique relations

equat the equations among strings of relations

# Note

The maximum length of the strings in the equations is currently 4.

# Author(s)

Antonio Rivero Ostoic

54 summaryBundles

# **Examples**

summaryBundles

Summary of Bundle Classes

## **Description**

Pretty printing of the bundle class patterns results.

# Usage

```
summaryBundles(x, file = NULL, latex = FALSE, byties)
```

## **Arguments**

x	an object of the 'Rel.Bundles' class
file	(optional) the path where the output file is to be placed
latex	(logical) whether the output should be in latex format or not
byties	(optional and logical) expand tie patterns and collapse tie labels?

# **Details**

This function prints the bundle census patterns existing in the network with an option to export such information in a friendly format. The dyadic bundle patterns are provide by the function bundles; however the outcome of this function provides a list of pair lists for each bundle with the involved types of relations and nodes in the network. This form for presentation, although is convenient for further computation, it is not always easy to read for a human eye. The pair separator used to print the bundle occurrences is taken from the output of the bundles function.

If latex is set to TRUE, then the path file is activated to obtain a tex file with the different bundle class patterns. Finally, the optional argument byties provides a more precise information of the patterned ties disregarding the relational content.

transf 55

## Value

The distinct bundle class patterns with a user friendly format.

#### Note

If a file with the same name already exists in the pointed directory, then this file will be overwritten.

#### Author(s)

Antonio Rivero Ostoic

## Establish the different bundles
bd <- bundles(arr)

## Print the different relational bundles
summaryBundles(bd)</pre>
```

transf

Transform Data from/to Matrix/List Formats

# **Description**

Function to transform data from/to matrix/list formats representing a network.

# Usage

56 transf

## **Arguments**

X	an array or a list of pair relations
type	whether the transformation is from a list of pair relations to an array format ("toarray"), from a matrix to a list of pair relations ("tolist"), from a list of pair relations to a square array ("toarray2"), or else from a matrix or array into an edge list ("toedgel").
lbs	(optional) the labels in the transformation (disabled for "toarray")
1b21b	(optional and logical) whether the transformation is label-to-label. Default TRUE for "toarray" and FALSE for "tolist" $$
sep	(optional) the pair separator for the pairwise relations
ord	(optional) the order of the resulted structure ("toarray" option, otherwise ignored) $ \\$
sort	(optional and logical) sort the arrays in the output?
sym	(optional and logical) symmetrize the arrays? ("toarray" option, otherwise ignored)
add	(optional) add elements in the array's "domain"
adc	(optional) add elements in the array's "codomain"

## **Details**

The option "tolist" is to transform a matrix or an array to a list of pair elements. In case that the lb2lb is enabled in this type of transformation, then lbs must be provided, whereas the pair separator is optional. On the other hand, "toarray" will produce a matrix from a list of pair elements, and in this case is advisable to specify the order of the structure. Three-dimensional structures are now supported.

Data frames are also accepted for the "tolist" option, and in case that such information is given as a list of pair relations, the output will be a square matrix.

# Value

Depending on the input data, the result is either a list of pair relations or a matrix of relations.

## Note

For high dimensional arrays, the rel.sys function provides additional information other than the list of pair relations of the entire structure.

wordT 57

## **Examples**

```
## scan the multiplication table data s \leftarrow matrix(data=c(1, 1, 1, 3, 3, 3, 3, 3), nrow=3, ncol=3, byrow=TRUE) ## transform the matrix to a list format transf(s, lb2lb = TRUE, lbs = c('n','m','ñ'))
```

wordT

The Word Table of Relations

## **Description**

The Word Table of multiple relations.

# Usage

wordT(x)

# **Arguments**

Χ

an array; usually with three dimensions of stacked matrices where the multiple relations are placed.

#### **Details**

The Word Table is a consequence of the Edge Table and the function gives a list of indexed elements in the complete semigroup.

In terms of the Cayley graph of the semigroup (cf. CRANpkgccgraph), the collection of unique relations (both compound and generators) are represented by nodes. On the other hand, the generators are edges that record the result of post-multiplying the compound relations by the generators.

## Value

An object of the 'WordTable' class

gens the generator relations

WT the Word Table where "n" stands for "node" and "g" stands for "generator"

The generators do not have values in neither the "node" nor the "generator" of the Word table since they are not product of any other element in the semigroup (cf. details for the rest of the values).

#### Note

The labels for the elements can be retrieved by the strings function.

Write dat Files

## **Description**

A function to write dat files.

# Usage

```
write.dat(x, path)
```

# Arguments

x an object representing the multiple network structure path the path file for the output

# **Details**

'dat' files are the format used in the Pacnet program. In case that the input data represents a multiple network then a separate file will be produced, each one representing a single type of relationship in the system. The name of the output files depends on the object title.

## Value

File(s) with adjacency matrices with a .dat format  $% \left( s\right) =\left( s\right) \left( s\right)$ 

# Note

In case that the directory in the path for the output does not exist then it will be created automatically.

Write gml Files

# Description

A function to write files with a gml format.

## Usage

```
write.gml(x, file = NULL)
```

# **Arguments**

x an object representing the multiple network

file path to the file

## **Details**

The gml format, an acronym for *graph modelling language*, provides capabilities to represent multiple networks and add arguments to both the nodes and the edges for visualization purposes.

## Value

A file with the data with a graph modelling language format.

# Note

In case that the file already exists in the pointed directory, then the file will be overwritten.

write.srt

Write srt Files

# Description

A function to write srt files

# Usage

```
write.srt(x, file = NULL, sep = "\t", header = TRUE)
```

# Arguments

X	an object rep	presenting the	multiple network
^	an object rep	mesenting the	mumpic network

file path to the file

sep the separator used between the columns

header (logical) whether the header should be included in the file

# **Details**

srt stands for send, receive, and ties, and it is a data frame with at least 3 columns for the sender, receiver, and the ties, one column for each type of relation.

# Value

A file with the data with a .srt format

# Author(s)

Antonio Rivero Ostoic

# See Also

```
read.srt,, write.dl
```

62 zbind

zbind

Combine Arrays

# **Description**

Combine multidimensional arrays.

# Usage

```
zbind(...)
```

## **Arguments**

.. One or more arrays with two or three dimensions

# **Details**

This function is for stacking two-dimensional arrays into a single three-dimensional object to represent a multivariate system structure. Both square and rectangular arrays are supported provided that the dimensions in the input are equal. The dimnames in the output correspond to the first array in the input, and a Warning message is given when these are NULL.

#### Value

Usually a three dimensional array

## Note

Data frames should be transformed into arrays
