Package 'sfdct'

January 6, 2021

Title Constrained Triangulation for Simple Features

Version 0.1.0

Description Build a constrained Delaunay triangulation from simple features
objects, applying constraints based on input line segments, and triangle
properties including maximum area, minimum internal angle. The triangulation code
in 'RTriangle' uses the method of Cheng, Dey and Shewchuk (2012, ISBN:9781584887300).
For a low-dependency alternative with low-quality path-based constrained
triangulation see <https://CRAN.R-project.org/package=decido> and for high-
quality configurable
triangulation see <https://CRAN.R-project.org/package=anglr>.

R **topics documented:**

---

antarctica   *Antarctica, and not Antarctica.*

Description

See data-raw for original source.

Examples

```
library(sf)
plot(antarctica, col = rainbow(nrow(antarctica), alpha = 0.4))
```

---

ct_triangulate   *Constrained Delaunay Triangulation*

Description

Triangulate simple features including the input edges as constraints, rather than being bounded to
the convex hull.

Usage

```
ct_triangulate(x, ...)

## S3 method for class 'POINT'
ct_triangulate(x, trim = TRUE, ...)

## S3 method for class 'MULTIPOINT'
ct_triangulate(x, trim = TRUE, ...)

## S3 method for class 'GEOMETRYCOLLECTION'
ct_triangulate(x, trim = TRUE, ...)

## S3 method for class 'sfg'
ct_triangulate(x, trim = TRUE, ...)

## S3 method for class 'sfc'
```

```
ct_triangulate(x, ...)

## S3 method for class 'sf'
ct_triangulate(x, trim = TRUE, ...)
```

Arguments

x	simple feature geometry or data frame
...	arguments for [triangulate](), see details
trim	drop triangles that fall "outside" i.e. "holes" and non-convex regions, `TRUE` by default

Details

This is not a Delaunay Triangulation by default, but is "mostly-Delaunay". Use the `D = TRUE` option, passed to the underlying function in RTriangle to ensure the criterion is met, as well as edge constraints.

All POLYGON, LINESTRING, MULTIPOLYGON, and MULTILINESTRING inputs (including those in GEOMETRYCOLLECTION) are broken down into line segments that are included in the mesh. Holes are removed by default, but can be retained with the `trim` argument.

The triangles are collected as POLYGONs within a GEOMETRYCOLLECTION, and in the case of an `sf` object it's returned within the original input data frame.

There's no way in this package to retain the set of shared vertices, or the segment or the triangle indices. It is a fundamental feature of the standard, that this information is not represented.

Further arguments may be passed down to the underlying triangulation function [triangulate](). Note that planar coordinates are assumed, no matter what projection the input is in. There's no sensible meaning to a value for a in units m^2 for a layer that is in longitude/latitude, for those use "area in square degrees", the straightforward meaning in planar coordinates. These arguments are, from the documentation of that function:

- a a Maximum triangle area. If specified, triangles cannot be larger than this area.

- q Minimum triangle angle in degrees.

- Y If `TRUE` prohibits the insertion of Steiner points on the mesh boundary.

- j If `TRUE` jettisons vertices that are not part of the final triangulation from the output.

- D If `TRUE` produce a conforming Delaunay triangulation. This ensures that all the triangles in the mesh are truly Delaunay, and not merely constrained Delaunay. This option invokes Ruppert's original algorithm, which splits every subsegment whose diametral circle is encroached. It usually increases the number of vertices and triangles.

- S Specifies the maximum number of added Steiner points.

- V Verbosity level. Specify higher values for more detailed information about what the Triangle library is doing.

- Q If `TRUE` suppresses all explanation of what the Triangle library is doing, unless an error occurs.

Value

simple feature column [st_sfc](#) or data frame [st_sfc](#)

Note

GEOMETRYCOLLECTION as input is not yet supported.

Examples

```
library(sf)
nc <- read_sf(system.file("shape/nc.shp", package="sf"), quiet = TRUE)
nc_triangles <- ct_triangulate(nc[, c("NAME", "geometry")])
plot(nc[, "NAME"])
plot(nc_triangles, add = TRUE, col = NA, lty = "dotted")
idx <- c(4, 5, 6, 7, 8, 20, 21)
op <- par(mfrow = c(2, 1))
if (packageVersion("sf") <= '0.2.8'){
nc <- st_transform(nc, "+proj=eqc +ellps=WGS84")
}

plot(st_triangulate(nc[idx, c("NAME", "geometry")]), col = "grey")

## Warning ct_triangulate does correctly triangulate longitude/latitude data
plot(ct_triangulate(nc[idx, c("NAME", "geometry")]))
```

---

lakesuperior   *Lake Superior polygons.*

Description

See data-raw for original source.

---

map_world   *The 'world' database from the* maps *package.*

Description

Data is in sf form. See data-raw for original source.

---

sfdct   *sfdct.*

Description

Triangulate simple features including the input edges as constraints, rather than being bounded to the convex hull.
