

Package ‘shinyrecap’

January 20, 2019

Type Package

Title Shiny User Interface for Multiple Source Capture Recapture Models

Version 0.1.0

Author Ian E. Fellows

Maintainer Ian E. Fellows <ian@fellstat.com>

Description Implements user interfaces for log-linear models, Bayesian model averaging and Bayesian Dirichlet process mixture models.

License MIT + file LICENCE

Imports Rcapture, shiny, shinycssloaders, conting, ggplot2, reshape, CARE1, dga, LCMCR, ipc, future, promises, coda, testthat

`shinyrecap-package`

Shiny User Interface for Multiple Source Capture Recapture Models

Description

Implements user interfaces for log-linear models, bayesian model averaging and bayesian dirichlet process mixture models.

Author(s)

Ian E. Fellows <ian@fellstat.com>

`disaggregate`

disaggregate data

Description

disaggregate data

Usage

```
disaggregate(dat, counts)
```

Arguments

dat	a data.frame
counts	frequency counts for each row

`formatGraphs`

Format graphs

Description

Format graphs

Usage

```
formatGraphs(graphs)
```

Arguments

graphs	the graphs
--------	------------

launchShinyPopSize *Launches the Shiny Application for Population Size*

Description

Launches the Shiny Application for Population Size

Usage

```
launchShinyPopSize(app = c("estimation", "power"))
```

Arguments

app Which application to launch.

Details

The manual for this shiny application is located at <https://fellstat.github.io/shinyrecap/>

lcmcrSample *Perform LCMCR sampling with a monitor function*

Description

Perform LCMCR sampling with a monitor function

Usage

```
lcmcrSample(object, burnin = 10000, samples = 1000, thinning = 10,
            clear_buffer = FALSE, output = TRUE, nMonitorBreaks = 100,
            monitorFunc = function(subs, tot) { })
```

Arguments

object	the samples
burnin	MCMC burn in
samples	number of samples
thinning	MCMC thinning
clear_buffer	buffer clear buffer of object
output	output progress
nMonitorBreaks	number of times to call the monitor function
monitorFunc	A function called nMonitorBreaks times taking the number of samples to be taken, and the total samples

Details

An edited version of lcmCR_PostSampl

simulateCapture	<i>Simulate Capture Re-capture with heterogeneity</i>
-----------------	---

Description

Simulate Capture Re-capture with heterogeneity

Usage

```
simulateCapture(hetero, p)
```

Arguments

hetero	The heterogeneity
p	A vector of capture event probabilities

Examples

```
het <- simulateHeteroNormal(1000, 1.1)
cap <- simulateCapture(het, p = c(.05,.1,.05,.1))
summary(cap)
```

simulateEstimates	<i>Simulates capture re-capture estimates</i>
-------------------	---

Description

Simulates capture re-capture estimates

Usage

```
simulateEstimates(nsim, N, p, htype = "None", heteroPerc = 1,
  monitorFunc = function(i) { })
```

Arguments

nsim	number of simulations
N	Population size
p	A vector of capture event probabilities
htype	The type of capture heterogeneity. Either "None" or "Normal"
heteroPerc	The increase in odds of capture for the perc 90th percentile most likely to be captured individuals, compared to the average individual.
monitorFunc	A function called after every iteration. Useful for monitoring simulation progress.

Examples

```
library(ggplot2)
# Simulate estimates from the Mt model with no population heterogeneity
ests <- simulateEstimates(15,500,c(.1,.1,.1))

# Simulate estimates from the Mth (Normal) model with no population heterogeneity.
ests2 <- simulateEstimates(20,500,c(.1,.1,.1), htype="Normal")

df <- data.frame(est = ests[[1]],type="Mt")
df <- rbind(df, data.frame(est = ests2[[1]],type="Mth (Normal)"))
qplot(x=est, color=type, data=df, geom="density") +
  geom_vline(xintercept=500,color="purple")
```

`simulateHeteroNormal` *simulate capture heterogeneity*

Description

simulate capture heterogeneity

Usage

```
simulateHeteroNormal(N, heteroPerc = 1, perc = 0.9)
```

Arguments

N	Population size
heteroPerc	The increase in odds of capture for the perc 90th percentile most likely to be captured individuals, compared to the average individual.
perc	The percentile to use.

Examples

```
het <- simulateHeteroNormal(100, 1.1)
hist(het)
```
